

NAME

cfftot1 – convert PostScript font from CFF to Type 1

SYNOPSIS

cfftot1 [-a] [input [output]]

DESCRIPTION

Cfftot1 converts PostScript font programs in the Compact Font Format (CFF) into Type 1 font programs in PFB or PFA format, preserving all hints that can be represented in Type 1. The input file should be a raw CFF file or a PostScript-flavored OpenType font. If the file *output* is not specified output goes to the standard output. If the file *input* is not specified input comes from the standard input.

OPTIONS

-a, --pfa

Output font in ASCII PFA format.

-b, --pfb

Output font in binary PFB format. This is the default.

-n name, --name name

Output the CFF's component font named *name*. CFF files can contain more than one font, although few do. Use this option to select a particular font from a multi-font collection. By default cfftot1 chooses the collection's first font.

-o file, --output file

Write output font to *file* instead of the standard output.

-q, --quiet

Do not generate any error messages.

-h, --help

Print usage information and exit.

-v, --version

Print the version number and some short non-warranty information and exit.
