

# The `fancy tooltips` package<sup>\*†</sup>

Robert Mařík  
`marik@mendelu.cz`

December 16, 2010

## 1 Introduction

The package `fancy tooltips` is a package for L<sup>A</sup>T<sub>E</sub>X. The pdf can be created by `pdflatex` or by `latex + dvips + AdobeDistiller1 + Adobe Acrobat2`. It allows to create tooltips in a similar way like `cool tooltips` package, but the tooltip is a page from another PDF file. In this way you can use mathematics, pictures and animations in your tooltips. The resulting PDF file can be used also with free Adobe Reader.

The tooltips are activated by clicking the active area on the screen and deactivated after closing page or by moving mouse outside the link. You can try the links [here](#) (Einstein's formula) and also [here](#) (animation – numbers from 1 to 6). You have to use the free Adobe Reader or nonfree Adobe Acrobat to see the effect (`xpdf`, `evince` and others fail to work with JavaScripts). For more examples how the presentation may look like see the `examples` subdirectory.

Similar functionality can be achieved using `pdfcomment` (smaller size of the resulting PDF, but restricted to plain text), `ocgtools` (works with layers, only `pdflatex` is supported) and `AcroTeX` (works with layers, only `latex + dvips + Adobe Distiller + Adobe Acrobat` are supported). All these “similar” packages allow to write the text for the tooltips and the text for the main document in one file. In contrast to this approach, `fancy tooltips` package makes use of an external file. However, if you prefer to write both tooltips in one file, you can preprocess your file using `preview` package and extract tooltips automatically, as shown in the `examples/fancy-preview` directory.

The buttons are created using `eforms.sty` which is a part of AcroTeX bundle.

---

<sup>\*</sup>This document corresponds to `fancy tooltips` v1.8, dated 2010/06/10.

<sup>†</sup>Supported by grants 18/2006, 99/2008 and 131/2010 of Higher Education Development Fund (FRVŠ)

<sup>1</sup>not free `ps2pdf`

<sup>2</sup>not free Adobe Reader.

## 2 Usage

### 2.1 How the package works

We have to prepare external file with content of tooltips first. The pages of this external file are inserted as icons at hidden buttons into the presentation. Whenever we use a command to insert tooltip, the following actions are performed

- The current page is covered by invisible transparent button which spans across the whole page (the information about the pages with tooltips is stored in `aux` file and hence we have to run L<sup>A</sup>T<sub>E</sub>X *three times*). The button has an associated JavaScript action to close all tooltips (i.e. make itself and other related buttons hidden).
- The button is created in text. This button is transparent, covers the text typeset by T<sub>E</sub>X into `\hbox` of dimension 0 pt and allows to activate a JavaScript. This JavaScript takes the picture required, puts this picture as icon to the button which covers the corresponding page and makes this button visible.
- Each page has an associated action which closes all tooltips when the page is opened.

### 2.2 The file with tooltips

The file with tooltips is an ordinary pdf file, one tooltip per page, tooltips should be in the top right corner at the page, in a colored box and the rest of the page should be transparent. If you consider to use `movetips` option (see below), then every page should have the dimensions equal to the dimensions of the colored box with tooltip<sup>3</sup>. We also provide simple cross referencing mechanism to reffer to the tooltips. If the pdf file is created by L<sup>A</sup>T<sub>E</sub>X, you can define keywords to reffer to the pages using `\keytip` command. Simply put `\usepackage[createtips]{fancytips}` into preamble and write `\keytip{\langle foo \rangle}` in document. This writes information about keyword `\langle foo \rangle` and the pagenumber into file `\jobname.tips`.

### 2.3 The file with presentation – pdfl<sup>A</sup>T<sub>E</sub>Xusers

In the file with presentation, the user is responsible

- input either `color` or `xcolor` package in the preamble
- L<sup>A</sup>T<sub>E</sub>X the file two times (we write some macros into `aux` file).

This is not comfortable for the user, but everybody uses different set of packages and from this reason, this part is left to the user. (And among others, the `color`

---

<sup>3</sup>Look at the files `tooltipy.tex` and `tooltipy.pdf` from `examples` subdirectory for a simple example how to meet this condition under pdfl<sup>A</sup>T<sub>E</sub>X

or `xcolor` package is probably inputted by the package which is used to build the presentation.)

**filename** To input the tooltips from file  $\langle\text{foo.pdf}\rangle$  call the package with `filename` option: `\usepackage[filename=foo]{fancytooltip}`.

**movetips** By default, tooltip appears in the top right corner of the page (use View–PageLayout–Single Page in your Adobe Reader, please). If the option `movetips` is used, then tooltip appears close to the mouse pointer. More precisely, tooltip appears with left down corner at the mouse position, if there is enough place. If not, tooltip appears with right down corner at the mouse position. Finally, the tooltip is shifted down to fit the page, if necessary<sup>4</sup>.

**mouseover** If you use `mouseover` option, then tooltip appears if you move the mouse pointer to the active area (no clicking is necessary).

**inactive** This option makes the package inactive.

**active** This option forces the package active even if `inactive` option is loaded.

**blur** The rest of the page is blurred, when showing tooltip. Use either `\usepackage[blur]{fancytooltip}` or `\usepackage[blur=number]{fancytooltip}`, where `number` is a number between 0 and 1. (Note that we use transparent package and hence this could have an influence on the colors of the document and could make your PDF less portable.) This option is allowed in pdfLATEX mode only. If this options brakes colors only on the page which include tooltips, you may want to use option `fixcolor` to fix it.

**debug** Prints two alerts reporting success or problems when opening PDF file in Adobe Acrobat (Adobe Reader). Use this option to find possible source of problems. See also the section Troubleshooting ... in this manual.

**noextratext** Do not append any mark at the end of the link which opens tooltips (see help for `\tooltip`).

**fg** The button for displaying pictures is placed on background and the buttons which activate tooltips are placed immediately in the text by default. With `fg` option all these buttons are placed into foreground after the page is completed. We use `\pdfsavepos` command and keep track of the position for buttons in aux file and hence this option works in pdfLATEX only and the file needs more compilations. This option does not do anything in dvi mode now (despite the fact that pdfLATEX provides the feature also for dvi mode), but this could be changed if someone requests this feature. Use this option for example, if you use buttons and forms in your PDF (like tests produced by AcroTEX) and the tooltips should be on the top when displayed.

---

<sup>4</sup>This option works in this way if every page of the file with tooltips has dimensions of the box with tooltip. See the `examples` subdirectory.

\tooltip	The user can put the tooltip into her or his presentation using the command <code>\tooltip{\langle stuff \rangle}{\langle keyword-or-pagenumber \rangle}</code> where <code>\langle stuff \rangle</code> is the printed text in <code>\tooltipcolor</code> color and <code>\langle keyword-or-pagenumber \rangle</code> is either the pagenumber of the tooltip in the external file or the keyword defined by <code>\keytip</code> command and stored in <code>\TooltipFilename.tips</code> file, where <code>\TooltipFilename</code> is set automatically from the <code>filename</code> option. The printed text <code>\langle stuff \rangle</code> is followed by <code>\TooltipExtratext</code> command. The default value is small blue soap, as you have seen in the second paragraph of this documentation. There is a package <code>noextratext</code> which defines <code>\TooltipExtratext</code> to be empty. If <code>\langle keyword-or-pagenumber \rangle</code> is not recognized as valid keyword for tooltips,
\TooltipExtratext	
noextratext option	
\tooltip*	The text <code>\{ \langle stuff \rangle \}</code> is inserted in <code>\hbox</code> by <code>\tooltip</code> . With starred version of the <code>\tooltip</code> macro the text <code>\{ \langle stuff \rangle \}</code> is not inserted into the box and the active button dos not cover the text <code>\{ \langle stuff \rangle \}</code> , but covers the mark produced by <code>\TooltipExtratext</code> .
\tooltipanim \tooltipanim* \delayinterval	The user can put a series (animation) of tooltips into the presentation by using <code>\tooltipanim{\langle stuff \rangle}{\langle start \rangle}{\langle end \rangle}</code> command, where <code>\langle start \rangle</code> and <code>\langle end \rangle</code> are keywords defined by <code>\keytip</code> command or page numbers. The delay between two frames is <code>\delayinterval</code> milliseconds. The default value is 200, you can change it by command <code>\def\delayinterval{100}</code> . There is also starred version which works similarly like <code>\tooltip*</code> command.
\FancyHook	Redefines <code>\ref</code> and <code>\eqref</code> commands to work with preview, see the demo files in <code>example/fancy-preview</code> directory.
\TooltipRefmark	Extra text added to <code>\ref</code> and <code>\eqref</code> commands with previews, see the demo files in <code>example/fancy-preview</code> directory. The default value is the same as for <code>\TooltipExtratext</code> .

## 2.4 Changes for dvips users

Dvips users also have to prepare tooltips into PDF file, not eps as usual. But we have to insert these tooltips in Adobe Acrobat Pro program. If you use Acrobat Pro version 8.1 and later, install the file `aeb.js` from AcroTeX eDucation bundle as described in the documentation to AcroTeX.<sup>5</sup>

Since L<sup>A</sup>T<sub>E</sub>X is not capable to find the number of pages in external PDF file with tooltips, dvips users have to specify option `dvips` in `fancytooltip`s package. You have to use also a `pages` option with the number of pages in the PDF file with tooltips, if you use dvips route. You have to call the package by something like this:

```
\usepackage[dvips,filename=tooltipy,pages=27]{fancytooltip}
```

You have to `latex` (two times) and `dvips` your file first. This produces `filename.ps` and `Tooltipsdljs.fdf` files. Distill the `filename.ps` file into `filename.pdf` and open this file by Adobe Acrobat Professional – this imports macros from `Tooltipsdljs.fdf` file. In Acrobat's JavaScript console (open by `Ctrl+J`) run (using `Ctrl+Enter`) the command `ImportToolips()`; which is defined for the document. This command inserts invisible buttons on the first page,

---

<sup>5</sup>If you do not install `aeb.js` properly, you can still create your presentation , but you have to import `fdf` file manually, see the section Troubleshooting and known problems.

imports icons (the file with icons specified as `<filename>` parameter when loading fancy tooltips must be in working directory). You should see a message “**importing pictures**” and the command returns 1 when finished. Then **save the file** (you can use the same name). If the command `ImportToolips()`; fails, you either have not the PDF file with tooltips in current directory, or the PDF file does not contain JavaScripts. In the latter case insert document level JavaScripts manually as described in the next section.

### 3 Troubleshooting and known problems

The source code is in Mercurial repository at <http://bitbucket.org/robert.marik/fancy tooltips/>. You can also report problems and issues in the forum at this site. The code on [bitbucket.org](http://bitbucket.org) is considered as development version and repository for older versions. The last stable version is always the version from CTAN.

- The package works with `eforms.sty` from version 2006/10/03 v1.0a. You can download this or newer version from [www.arotex.net](http://www.arotex.net) site.
- If the graphics included by `\TooltipExtratext` and `\TooltipRemark` has colors with **custom opacity**, Adobe Acrobat Pro sometimes renders the pictures bad. No problems of this type have been observed with free Adobe Reader.
- For `dvips` users: In some cases the file `Tooltipsdljs.fdf` is **not imported automatically** (probably some setting in Adobe Acrobat or new versions of `eforms.sty` and `insdljs.sty`). In this case you do not see any message when using `debug` option. You have troubles of this type if you see in the Javascript console (Ctrl+J) error messages like “`aebTrustedFunctions is not defined 3:Page:Open CloseTooltips is not defined 1:Page:Open`”. In this case you have to import the file `Tooltipsdljs.fdf` **manually from “Form” menu** in Adobe Acrobat Pro. Then go to the JavaScript console and run `ImportToolips()`; command.

Follow the points below if you want to find the source of your problems.

- For dvips users it is a good idea to check that AcroTeX is properly installed. Do the demo files from AcroTeX work for you?
- Try to use `debug` option, prepare the PDF file and open it in Adobe Acrobat or Adobe Reader.
  - You should see two messages when opening the file. If not, the Javascript do not work in your document (are not inserted properly).
  - Both messages should report success for pdflatex users. For dvips users one of the message should report error and if you run `ImportToolips()`; command in Javascript console, you should see a message in Javascript

console which confirms that the pictures from external PDF file have been imported. If you save the PDF file and open again, both messages should report success.

```

In the macros `\tooltip` and `\tooltipanim` we print the text into box with zero dimensions and then we build a button which covers this text and has an associated JavaScript action. The important part is the `\PushButton` macro. You can adjust these macros or write similar macros which do what you need.
