# An Extension of the LATEX-Theorem Evironment\*

Wolfgang May<sup>‡</sup>

Andreas Schedler<sup>§</sup>

Institut für Informatik, Universität Göttingen Germany

2011/02/16

#### Abstract

ntheorem.sty is a package for handling theorem-like environments. Additionally to several features for defining the layout of theorem-like environments which can be regarded to be standard requirements for a theorem-package, it provides solutions for two related problems: placement of endmarks and generation of lists of theorem-like environments.

In contrast to former approaches, it solves the problem of setting endmarks of theorem-like environments (theorems, definitions, examples, and proofs) *automatically* at the right positions, even if the environment ends with a **displaymath** or (even nested) list environments, it also copes with the **amsmath** package. This is done in the same manner as the handling of labels by using the .aux file.

It also introduces the generation of lists of theorem-like environments in the same manner as **listoffigures**. Additionally, more comfortable referencing is supported.

After running  $I\!AT_E\!X$  several times (depending on the complexity of references, in general, three runs are sufficient), the endmarks are set correctly, and theoremlists are generated.

Since ntheorem.sty uses the standard  $\[MTex] \ \$  sty without having to change the .tex file. Also, it is compatible with  $\[MTex] \$  files using theorem.sty written by Frank Mittelbach.

<sup>\*</sup>This file has version number 1.31, last revised 2011/02/16.

## 1 Introduction

For our purposes here, "theorems" are labelled enunciations, often set off from the main text by extra space and a font change. Theorems, corollaries, conjectures, definitions, examples, remarks, and proofs are all instances of "theorems". The "header" of these structures is composed of the type of the structure (such as THEOREM or REMARK), a number which serializes the instances of the same type throughout the document, and an optional name (such as "Correctness Theorem"). The layout of theorems can be changed by parameters as the fonts of the header and the body, the way how to arrange the headers, the indentation, and the way of numbering it. Confronted with these requirements, **theorem.sty**, a style for dealing with theorem layout was developed by Frank Mittelbach which was the standard theorem-environment for long time.

But then the desire for additional features like "endmarks" and "theorem-lists" arose. Two extensions of theorem.sty were developped: One for handling endmarks, thmmarks.sty and one for generating lists, newthm.sty. Thus, Frank Mittelbach suggested to combine the new features into one "standard-to-be" package. And now, here it is.

## 2 The User-Interface

## 2.1 How to include the package

The package ntheorem.sty is included by

where the optional parameter  $\langle options \rangle$  selects predefined configurations and special requirements.

The following  $\langle options \rangle$  are available by now, concerning partially independent issues:

- **Predefined environments:** (see Section 2.3.6) With [standard] and [noconfig], it can be chosen, if and what file is used for activating a (user-defined) standard set of theorem environments.
- Fancy boxes around theorems: The [framed] option allows to use framed.sty that provides boxes even across pagebreaks.
- Activation of endmarks: [thmmarks] enables the automatical placement of endmarks (see 2.3); when using the amsmath-package, [thmmarks] must be complemented by [amsmath] (see Section 3.2).
- Activation of extended reference features: [thref] enables the extended reference features (see Section 4.1); when using the amsmath-package, [thref] must be complemented by [amsmath] (see Section 3.2).
- **Compatibility with amsthm:** option [amsthm] provides compatibility with the theorem-layout commands of the amsthm-package (see Section 3.2).
- **Compatibility with hyperref:** option [hyperref] provides compability with the hyperref-package (see Section 3.4).

The package itself loads ifthen.sty.

## 2.2 Defining New Theorem Sets

- \newtheorem The syntax and semantics is exactly the same as in standard LATEX: the command \newtheorem defines a new "theorem set" or "theorem-like structure". Two required arguments name the new environment set and give the text to be typeset with each instance of the new "set", while an optional argument determines how the "set" is enumerated:
  - \newtheorem{foo}{bar} The theorem set foo (whose name is bar) uses its own
    counter.
  - \newtheorem{foo2}[foo]{bar2} The theorem set foo2 (printed name bar2) uses
     the same counter as the theorem set foo.
  - \newtheorem{foo3}{bar}[section] The theorem set foo3 (printed name bar)
    is enumerated within the counter section, i.e. with every new \section the
    enumeration begins again with 1, and the enumeration is composed from the
    section-number and the theorem counter itself.

For every environment  $\langle name \rangle$  defined by **\newtheorem**, two environments  $\langle name \rangle$  and  $\langle name* \rangle$  are defined. In the main document, they have exactly the same effect, but the latter causes no entry in the respective list of theorems (cf. **\section** and **\section\***), see also Section 2.4.

\renewtheorem Theorem sets can be redefined by \renewtheorem, with the same arguments as explained for \newtheorem. When redefining a theorem set, the counter is not re-initialized.

## 2.3 Defining the Layout of Theorem Sets

For theorem-like environments, the user can set parameters by setting several switches and then calling **\newtheorem**. The layout of a theorem set is defined with the values of the switches at the time **\newtheorem** is called.

#### 2.3.1 Common Parameters for all Theorem Sets

\theorempreskipamount These additional parameters affect the vertical space around theorem environments: \theorempreskipamount and \theorempostskipamount define, respectively, the spacing before and after such an environment. These parameters apply for all theorem sets and can be manipulated with the ordinary length macros. They are rubber lengths, ('skips'), and therefore can contain plus and minus parts.

### 2.3.2 Parameters for Individual Sets

The layout of individual theorem sets can be further determined by switches controlling the appearance of the headers and the header-body-layout:

\theoremstyle	• \theoremstyle{( <i>style</i> )}: The general structure of the theorem layout is defined via its \theoremstyle. \ntheorem provides several predefined styles including those of Frank Mittelbach's theorem.sty (cf. Section 2.3.4. Additional styles can be defined by \newtheoremstyle (cf. Section2.5.1).
\theoremheaderfont	• \theoremheaderfont{(fontcmds)}: The theorem header is set in the font specified by (fontcmds).
	In contrast to theorem.sty, \theoremheaderfont can be set individually for each environment type.
\theorembodyfont	• \theorembodyfont{(fontcmds)}: The theorem body is set in the font specified by (fontcmds).
\theoremseparator	• \theoremseparator{ $\langle thing \rangle$ }: $\langle thing \rangle$ separates the header from the body of the theorem-environment. E.g., $\langle thing \rangle$ can be ":" or ".".
\theoremprework	• \theoremprework{\\ thing \}: \\ thing \\ is performed before starting the the- orem structure. E.g., \\ thing \\ can be \bigskip\hrule\leavevmode. If the vertical space after your theoremprework does not look as intended, try to put \leavevmode at its end (as in the above example).
theorempostwork	• \theorempostwork{ $\langle thing \rangle$ }: $\langle thing \rangle$ is performed after finishing the theorem structure. E.g., $\langle thing \rangle$ can be \hrule.
\theoremindent	• $\text{theoremindent} \langle dimen \rangle$ can be used to indent the theorem wrt. the surrounding text.
	! It's a '(dimen)', so the user shouldn't try to specify a plus or minus part, because this leads to an error.
\theoremnumbering	• \theoremnumbering{ $\langle style \rangle$ } specifies the appearance of the numbering of the theorem set. Possible $\langle styles \rangle$ are arabic (default), alph, Alph, roman, Roman, greek, Greek, and fnsymbol.
	Clearly, if a theorem-environment uses the counter of another environment type, also the numbering style of that environment is used.

\theoremsymbol	• $\text{theoremsymbol}{\langle thing \rangle}$ : This is only active if ntheorem.sty is loaded with
	option [thmmarks]. $\langle thing \rangle$ is set as an endmark at the end of every instance
	of the environment. If no symbol should appear, say .

The flexibility provided by these command should relieve the users from the ugly hacking in **\newtheorem** to fit most of the requirements stated by publishers or supervisors.

\theoremclass With the command \theoremclass{\theorem-type}} (where \theorem-type\) must
be an already defined theorem type), these parameters can be set to the values
which were used when \newtheorem was called for \theorem-type\.
With \theoremclass{LaTeX}, the standard LATeX layout can be chosen.

#### 2.3.3 Font Selection

From the document structuring point of view, theorem environments are regarded as special parts inside a document. Furthermore, the theorem header is only a distinguished part of a theorem environment. Thus, \theoremheaderfont inherits characteristics of \theorembodyfont which also inherits in characteristics of the font of the surrounding environment. Thus, if for example \theorembodyfont is \itshape and \theoremheaderfont is \bfseries the font selected for the header will have the characteristics 'bold extended italic'. If this is not desired, the corresponding property has to be explicitly overwritten in \theoremheaderfont, e.g. by \theoremheaderfont{\normalfont\bfseries}

#### 2.3.4 Predefined theorem styles

The following theorem styles are predefined, covering those from theorem.sty:

plain	This theorem style emulates the original LATEX definition, except that additionally the parameters $\theoremskipamount$ are used.
break	In this style, the theorem header is followed by a line break.
change	Header number and text are interchanged, without a line break.
changebreak	Like change, but with a line break after the header.
margin	The number is set in the left margin, without a line break.
marginbreak	Like margin, but with a line break after the header.
nonumberplain	Like plain, without number (e.g. for proofs).
nonumberbreak	Like break, without number.
empty	No number, no name. Only the optional argument is typeset.

## 2.3.5 Default Setting

If no option is given, i.e. ntheorem.sty is loaded by \usepackage{ntheorem.sty}, the following default is set up:

```
\theoremstyle{plain},
\theoremheaderfont{\normalfont\bfseries} and
\theorembodyfont{\itshape},
\theoremseparator{},
\theoremindent0cm,
\theoremnumbering{arabic},
\theoremsymbol{}.
```

Thus, by only saying  $\mbox{newtheorem}{\ldots}$ , the user gets the same layout as in standard LAT<sub>F</sub>X.

## 2.3.6 A Standard Set of Theorems

A standard configuration of theorem sets is provided within the file ntheorem.std, which will be included by the option [standard]. It uses the amssymb and latexsym (automatically loaded) packages and defines the following sets:

Theorems: Theorem, Lemma, Proposition, Corollary, Satz, Korollar,

Definitions: Definition,

Examples: Example, Beispiel,

Remarks: Anmerkung, Bemerkung, Remark,

Proofs: Proof and Beweis.

These theorem sets seem to be the most frequently used environments in english and german documents.

The layout is defined to be theoremstyle plain, bodyfont \itshape, Headerfont \bfseries, and endmark (theoremsymbol) \ensuremath{\_\Box} for all theoremlike environments<sup>1</sup>. For the definition-, remark- and example-like sets, the above setting is used, except bodyfont \upshape. The proof-like sets are handled a bit differently. There, the layout is defined as theoremstyle nonumberplain, bodyfont \upshape, headerfont \scshape and endmark \ensuremath{\_\blacksquare}. For a more detailed information look at ntheorem.std or at the code-section.

#### 2.3.7 Framed and Boxed Theorems

With the advent of the **framed** package (by Donald Arseneau) in 2001, a feature that has often been asked for for ntheorem could be implemented: theorems that are framed, or that are put into a colored box. It requires to load the **framed** package; shaded theorems also require the **pstricks** package. Frames and colored boxes are orthogonal to the existing theoremstyles – thus, they can be combined in arbitrary ways.

\newframedtheorem A theorem type can be framed by defining it by

 $\mbox{newframedtheorem}{\ldots}{\ldots}{\ldots}$ 

with the same parameters as usually for \newtheorem. Note that the use of the framed package also allows to have longer theorems across a page break framed (in this case, by default, there are horizontal lines before and after the page break; this can even be circumvented by combining with mdframed package (since 2010)).

The same ideas hold for theorems in shaded boxes. The declaration

 $\mbox{newshadedtheorem}{\ldots}{\ldots}{\ldots}$ 

declares a theorem environment that is shaded. By default, the background color is gray. This can be changed by defining

before declaring the theorem type. Note that later declarations of other shaded theorem types can use another shadecolor.

By default, the box is given as a \psframebox (see pstricks package) with shadecolor as linecolor and fillcolor. All these parameters can be changed by setting

 $\det\\ box command{ any box command}$ 

before declaring the theorem type (for examples, the user is referred to section 4). For using pdflatex (where pstricks is not available), e.g. \usepackage{color} and \theoremframecommand{\colorbox[rgb]{1,.9,.9}} can be used.

Note that **\theorempreskipamount** and **\theorempostskipamount** are applied integrated with the structure of the theorem itself. Thus, for framed and shaded theorems, they are applied *inside* the frame/shade.

To obtain vertical space *before* and *after* the shade or frame, \theoremframepreskipamount and \theoremframepostskipamount can be used (both defined by default to 0pt) analogously. (i.e., they are also common to all theorem types.)

#### 2.3.8 Customization and Local Settings

Since the user should not change ntheorem.std, we've added the possibility to use an own configuration-file. If one places the file ntheorem.cfg in the path searched by T<sub>E</sub>X, this file is read automatically (if [standard] is not given). The usage of ntheorem.cfg can be prevented by the [noconfig] option. Thus, just a copy of ntheorem.std to ntheorem.cfg must be made which then can freely be modified by the user. Note, that if a configuration-file exists, this will always be used (I.e. with option standard and an existing configuration-file, the .cfg file will be used and the .std file won't.

## 2.4 Generating Theoremlists

\listtheorems

sorems Similar to the LATEX command \listoffigures, any theorem set defined with a \newtheorem statement may be listed at any place in your document by

#### $listtheorems{\langle list \rangle}$

The argument  $\langle list \rangle$  is a comma-separated list of the theorem sets to be listed. For a theorem set  $\langle name \rangle$ , only the instances are listed which are instantiated by \begin{ $\langle name \rangle$ }. Those instantiated by \begin{ $\langle name \rangle$ \*} are omitted (cf. \section and \section\*).

For example, \listtheorems{Corollary,Lemma} leads to a list of all instances of one of the theorem sets "Corollary" or "Lemma". Note, that the set name given

<sup>&</sup>lt;sup>1</sup>Note, that mathemode is ensured for the symbol.

to the command is the first argument which is specified by **\newtheorem** which is also the one to be used in **\begin{theorem}** ... **\end{theorem}**.

If \listtheorems is called for a set name which is not defined via \newtheorem, the user is informed that a list is generated, but there will be no typeset output at all.

Note that in contrast to similar  $IAT_EX$  commands like listoffigures etc. there is no automatically created heading. Users have to write it themselves – but are free to choose what they want to have.

#### 2.4.1 Defining the List Layout

\theoremlisttype Theoremlists can be formatted in different ways. Analogous to theorem layout, there are several predefined types which can be selected by

#### $\text{theoremlisttype} \{ \langle type \rangle \}$

The following four  $\langle type \rangle$ s are available (for examples, the user is referred to section 4).

- all List any theorem of the specified set by number, (optional) name and pagenumber. This one is also the default value.
- allname Like all, additionally with leading theoremname.
- opt Analogous to all, but only the theorems which have an optional name are listed.

optname Like opt, with leading theoremname.

#### 2.4.2 Writing Extra Stuff to the Theorem File

Similar to \addcontentsline and \addtocontents, additional entries to theoremlists are supported. Since entries to theoremlists are a bit more intricate than entries to the lists maintained by standard LATEX \addcontentsline and \addtocontents cannot be used in a straightforward way<sup>2</sup>.

\addtheoremline Analogous to \addcontentsline, an extra entry for a theorem list can be made by

#### 

where  $\langle name \rangle$  is the name of a valid theorem set and  $\langle text \rangle$  is the text, which should appear in the list. For example,

#### \addtheoremline{Example}{Extra Entry with number}

generates an entry with the following characteristics:

- The Label of the theorem "Example" is used.
- The current value of the counter for "Example" is used
- The current pagenumber is used.
- The specified text is the optional text for the theorem.

 $<sup>^{2}</sup>$ for a theorem, its number has to be stored explicitly since different theorem sets can use the same counter. Also, it is optional to reset the counter for each section.

Thus, the above command has the same effect as it would be for

#### \begin{Example}[Extra Entry with number] \end{Example}

except, that there would be no output of the theorem, and the counter isn't advanced.

\addtheoremline\* Alternatively you can use

#### \addtheoremline\*{Example}{Extra Entry}

which is the same as above, except that the entry appears without number.
\addtotheoremfile
Sometimes, e.g. for long lists, special control sequences (e.g. a pagebreak) or additional text should be inserted into a list. This is done by

where  $\langle name \rangle$  is the name of a theorem set and  $\langle text \rangle$  is the text to be written into the theorem file. If the optional argument  $\langle name \rangle$  is omitted, the given text is inserted in every list, otherwise it is only inserted for the given theorem set.

## 2.5 For Experts: Defining Layout Styles

## 2.5.1 Defining New Theorem Layouts

\newtheoremstyle Additional layout styles for theorems can be defined by

Since LATEX implements theorem-like environments by  $\trivlists$ , both header declarations must be of the form item[...theorem@headerfont ...]..., where the dotted parts can be formulated by the user. If there are some statements producing output after the item[...], you have to care about implicit spaces.

Because of the Q, if \newtheoremstyle is used in a .tex file, it has to be put between \makeatletter and \makeatother.

For details, look at the code documentation or the definitions of the predefined theorem styles.

\renewtheoremstyle Theorem styles can be redefined by \renewtheoremstyle, with the same arguments as explained for \newtheoremstyle.

#### 2.5.2 Defining New Theorem List Layouts

\newtheoremlisttype Analogous, additional layouts for theorem lists can be defined by

 $\mbox{newtheoremlisttype} \{ \langle name \rangle \} \{ \langle start \rangle \} \{ \langle end \rangle \}.$ 

The first argument,  $\langle name \rangle$ , is the name of the listtype, which can the be used as a valid **\theoremlisttype**.  $\langle start \rangle$  is the sequence of commands to be executed at the very beginning of the list. Corresponding,  $\langle end \rangle$  will be executed at the end of the list. These two are set to do nothing in the standard-types.  $\langle line \rangle$  is the part to

be called for every entry of the list. It has to be a statement using four arguments: **##1** will be replaced with the name of the theorem, **##2** with the number, **##3** with the theorem's optional text and **##4** with the pagenumber.

WARNING: Self-defined Layouts will break with the hyperref-package.

\renewtheoremlisttype

Theorem list types can be redefined by \renewtheoremlisttype, with the same arguments as explained for \newtheoremlisttype.

## 2.6 Setting End Marks

The automatic placement of endmarks is activated by calling ntheorem.sty with the option [thmmarks]. Since then, the endmarks are set automatically, there are only a few commands for dealing with very special situations.

\qedsymbol

\qed

If in a single environment, the user wants to replace the standard endmark by some other, this can be done by saying \qed, if \qedsymbol has been defined by \qedsymbol{{something}} (in option standard, \qedsymbol is defined to be the symbol used for proofs, since a potential use of this features is to close trivial corollaries without explicitly proving them).

Additionally, if in a single environment of a theorem set, that is defined without an endmark, the user wants to set an endmark, this is done with \qedsymbol and \qed as described above. \qedsymbol can be redefined everywhere in the document.

 $\$  On the other hand, if in some situation, the user decides to set the endmark man-  $\$  Under Mark On the other hand, if in some situation, the user decides to set the endmark man-  $\$  Under Mark (e.g. inside a figure or a minipage), the automatic handling can be turned off by  $\$  NoEndMark for the current environment. Then – assumed that he current environment is of type  $\langle name \rangle$ , the endmark can manually be set by just saying  $\langle name \rangle$  Symbol.

Note that there must be no empty line in the input before the \end{theorem}, since then, the end mark is ignored (cf. Theorem 3 in Section 4).

## 2.7 Extended Referencing Features

The extended referencing features are activated by calling **ntheorem.sty** with the option [thref].

Often, when writing a paper, one changes propositions into theorems, theorems into corollaries, lemmata into remarks an so on. Then, it is necessary to adjust also the references, i.e., from "see Proposition~\ref{completeness}" to "see Theorem~\ref{completeness}". For relieving the user from this burden, the type of the respective labeled entities can be associated with the label itself:

 $label{\langle label \rangle}[\langle type \rangle]$ 

associates the type  $\langle type \rangle$  with  $\langle label \rangle$ . This task is automated for theorem-like environments:

 $\begin{Theorem}[\langle name \rangle] \begin{Theorem}] \begin{Theorem}[\langle name \rangle] \begin{Theorem}] \begin{Theorem}[\langle name \rangle] \begin{T$ 

is equivalent to

**\thref** The additional information is used by

 $\times{\langle label \rangle}$ 

which outputs the respective environment-type and the number, e.g., "Theorem 42". Note that IATEX has to be run twice after changing labels (similar to getting references OK; in the intermediate run, warnings about undefined reference types can occur).

The [thref] option interferes with the babel package, thus in this case, ntheorem has to be loaded *after* babel. It also interferes with amsmath; see Section 3.2.

## 2.8 Miscellaneous

Inside a theorem-like environment  $\langle env \rangle$ , the name given as optional argument is accessible by  $\langle env \rangle$  name.

## **3** Possible Interferences

Since **ntheorem** reimplements the handling of theorem-environments completely, it is incompatible with every package also concerning those macros.

Additionally, the thmmarks algorithm for placing endmarks requires modifications of several environments (cf. Section 7). Thus, environments which are reimplemented or additionally defined by document options or styles are not covered by the endmark algorithm of ntheorem.sty.

The [thref] option changes the \label command and the treatment of labels when reading the .aux file. Thus it is potentially incompatible with all packages also changing \label (or \newlabel). Compatibility with babel's \newlabel isa achieved if babel is loaded before ntheorem.

## 3.1 Interfering Document Options.

ntheorem.sty also copes with the usual document options leqno and fleqn<sup>3</sup>. If one of those options is used in the \documentclass declaration, it is automatically recognized by the thmmarks part of ntheorem.sty.

If one of those options is not used in \documentclass, but with amsmath (see next section), it must not be specified for ntheorem, since all amsmath environments detect this option by themselves.

## 3.2 Combination with amslatex.

ntheorem.sty interferes with amsmath.sty and amsthm.sty.

Note, that the LaTeX amstex package amstex.sty (LaTeX2.09) is obsolete and you should use amsmath and amstext for LaTeX  $2_{\mathcal{E}}$  instead. Up to ntheorem-1.18, it is compatible with amsmath-1.x. Since ntheorem-1.19, it is (hopefully) compatible with amsmath-2.x.

We would be happy if someone knowing and using **amsmath** would join the development and maintenance of this style.

<sup>&</sup>lt;sup>3</sup>although for fleqn and long formulas reaching to the right margin, equation numbers and endmarks can be smashed over the formula since fleqn does not use \eqno for controlling the setting of the equation number.

#### 3.2.1 amsmath

Compatibility with amsmath (end marks for math environments, and handling of labels in math environments) is provided in the option [amsmath], (i.e., if \usepackage{amsmath} is used then

- \usepackage[thmmarks]{ntheorem} must be completed to \usepackage[amsmath,thmmarks]{ntheorem}), and also
- \usepackage[thref]{ntheorem} must be completed to \usepackage[amsmath,thref]{ntheorem}).

Note, that **amsmath** has to be loaded *before* **ntheorem** since the definitions have to be overwritten.

### 3.2.2 amsthm

amsthm.sty conflicts with the definition of theorem layouts in theorem.sty, some features of amsthm.sty have been incorporated into option [amsthm] which has to be used *instead of* \usepackage{amsthm}.

The option provides theoremstyles plain, definition, and remark, and a proof environment as in amsthm.sty.

The **\newtheorem\*** command is defined even without this option. Note that **\newtheorem\*** always switches to the nonumbered version of the current theorem-style which thus must be defined.

The command \newtheoremstyle is not taken over from amsthm.sty. Also, \swapnumbers is not implemented. Here, the user has to express his definitions by the \newtheoremstyle command provided by ntheorem.sty, including the use of \theoremheaderfont and \theorembodyfont. The options [amsthm] and [standard] are in conflict since they both define an environment proof.

Thus, we recommend not to use amsthm, since the features for defining theorem-like environments in ntheorem.sty—following theorem.sty—seem to be more intuitive and user-friendly.

## 3.3 Babel

The [thref] option interferes with the babel package, thus in case that babel is used, ntheorem has to be loaded *after* babel.

## 3.4 Hyperref

Since hyperref redefines the LATEX \contentsline-command, it breaks with ntheorem below version 1.17. Since version 1.17, the option [hyperref] makes ntheorem work with hyperref. The entries of theoremlists then act as hyperlinks to the actual theorems. Version 1.31 incorporated some bugfixes wrt. hyperref for theorem lists and for the thref option. One should always load \usepackage{hyperref} before the first use of \newtheorem to obtain correct handling and referencing of counters.

WARNING: The definition and redefinition of Theorem List Layouts (see Section 2.5.2) isn't yet working with the hyperref-package.

## 4 Examples

The setting is as follows.

• For Theorems:

```
\theoremstyle{marginbreak}
\theoremheaderfont{\normalfont\bfseries}\theorembodyfont{\slshape}
\theoremsymbol{\ensuremath{\diamondsuit}}
\theoremseparator{:}
\newtheorem{Theorem}{Theorem}
```

• For Lemmas:

```
\theoremstyle{changebreak}
\theoremsymbol{\ensuremath{\heartsuit}}
\theoremindent0.5cm
\theoremnumbering{greek}
\newtheorem{Lemma}{Lemma}
```

• For Corollaries:

```
\theoremindent0cm
\theoremsymbol{\ensuremath{\spadesuit}}
\theoremnumbering{arabic}
\newtheorem{Corollary}[Theorem]{Corollary}
```

• For Examples:

```
\theoremstyle{change}
\theorembodyfont{\upshape}
\theoremsymbol{\ensuremath{\ast}}
\theoremseparator{}
\newtheorem{Example}{Example}
```

• For Definitions:

```
\theoremstyle{plain}
\theoremsymbol{\ensuremath{\clubsuit}}
\theoremseparator{.}
\theoremprework{\bigskip\hrule}
\theorempostwork{\hrule\bigskip}
\newtheorem{Definition}{Definition}
```

• For Proofs (note that theoremprework and theorempostwork are reset – proofs do not have lines above and below):

```
\theoremheaderfont{\sc}\theorembodyfont{\upshape}
\theoremstyle{nonumberplain}
\theoremseparator{}
\theoremsymbol{\rule{1ex}{1ex}}
\newtheorem{Proof}{Proof}
```

Note, that parts of the setting are inherited. For instance, the fonts are not reset before defining "Lemma", so the font setting of "Theorem" is used.

1 Example (Simple one) The first example is just a text.

In the next examples, it is shown how an endmark is put at a displaymath, a single equation and both types of equarrays. \*

#### 1 Theorem (Long Theorem):

The examples are put into this theorem environment. The next example will not appear in the list of examples since it is written as

\begin{Example\*} ... \end{Example\*}

**2** Example (Ending with a displayed formula) Look, the endmark is really at the bottom of the line:

$$f^{(n)}(z) = \frac{n!}{2\pi i} \int_{\partial D} \frac{f(\zeta)}{(\zeta - z)^{n+1}} d\zeta$$

\*

At this point, we add an additional entry without number in the Example list:

\addtheoremline\*{Example}{Extra Entry}

#### $\alpha$ Lemma (Display with array):

Lemmata are indented and numbered with greek symbols. Also for displayed arrays of this form, it looks good:

```
\[\begin{array}{1}
    a = \begin{array}[t]{1}
    first\ line \\
    second\ line
    \end{array}%
    \mbox{try to put this text in the lowest line}\end{array}\]
```

Just try to get this with the presented array structure ... without using dirty tricks, you can position the outer array either [t], [c], or [b], and you will not get the desired effect.

$$a = first line$$
 try to put this text in the lowest line second line  $\heartsuit$ 

#### $\beta$ Lemma (Equation):

For equations, we decided to put the endmark after the equation number, which is vertically centered. Currently, we do not know, how to get the equation number centered and the endmark at the bottom (one has to know the internal height of the math material) ... If anyone knows, please inform us.

$$\int_{\gamma} f(z) \, dz := \int_{a}^{b} f(\gamma(t)) \gamma'(t) \, dt \tag{1}$$

With the break-theoremstyles, if the environment is labeled and written as

\begin{Lemma}[Breakstyle]\label{breakstyle}

#### $\gamma$ Lemma (Breakstyle):

you see, there is a leading space ...

If a percent (comment) (or an explicit \ignorespaces) is put directly after the label, e.g.

#### \begin{Lemma}[Breakstyle]\label{breakstyle}%,

the space disappears.

From the predefined styles, this is exactly the case for the break-styles. That's no bug, it's  $\[mathbb{LTE}X\]$ -immanent.

The example goes on with an eqnarray:

$$f(z) = \frac{1}{2\pi i} \int_{\partial D} \frac{f(\zeta)}{\zeta - z} d\zeta$$
<sup>(2)</sup>

$$= \frac{1}{2\pi} \int_{0}^{2\pi} f(z_0 + re^{it}) dt$$
 (3)

PROOF (OF NOTHING)

$$f(z) = \frac{1}{2\pi i} \int_{\partial D} \frac{f(\zeta)}{\zeta - z} d\zeta$$
$$= \frac{1}{2\pi} \int_{0}^{2\pi} f(z_0 + re^{it}) dt$$

That's it (the end of the Theorem).

If there are some environments in the same thm-environment, the last one gets the endmark:

Definition 1 (With a list).

$$\int_{\gamma} f(z) dz := \int_{a}^{b} f(\gamma(t)) \gamma'(t) dt$$
(4)

- you've seen, how it works for text and
- math environments,
- and it works for lists.

#### 2 Corollary (Q.E.D.):

And here is a trivial corollary, which is ended by \qedsymbol{\textrm{q.e.d}} and \qed. q.e.d

#### 3 Example

$$f^{(n)}(z) = \frac{n!}{2\pi i} \int_{\partial D} \frac{f(\zeta)}{(\zeta - z)^{n+1}} d\zeta$$

If there is some text after an environment, the endmark is put after the text. \*

÷

 $\diamond$ 

The next one is done by the following sequence. Note, that ~\hfill~ is inserted to prevent LATEX from using its nested list management (a verbatim is also a trivlist), i.e. this causes LATEX to start the verbatim-Part in a new line.

\end{Example}

4 Example (Using verbatim)

```
And, it also works for verbatim ... when the end{verbatim} is in the same line as the text ends.
```

There must be no empty line in the input before the **\end{theorem}** (since then, the end mark is ignored)

\begin{Theorem}
some text ... but no end mark

 $\end{Theorem}$ 

#### 3 Theorem:

. . .

some text ... but no end mark

Now, there is a corollary which should appear with a different name in the list of corollaries:

```
\begin{Corollary*}[title in text]\label{otherlabel}
```

\end{Corollary\*} \addtheoremline{Corollary}{title in list}

#### 4 Corollary (title in text):

let's do something weird:

It also works in the center environment.

¢

 $\diamond$ 

\*

#### 5 Theorem (Quote):

In quote environments, the text is normally indented from left and right by the same space. The endmark is not indented from the right margin, i.e., it is typeset to the right margin of the surrounding text.

Here is an example for turning off the endmark automatics and manual handling:

```
\begin{Theorem}[Manual End Mark]\label{somelabel}
a line of text with a manually set endmark \hfill\TheoremSymbol \\
some more text, but no automatic endmark set. \NoEndMark
\end{Theorem}
```

#### 6 Theorem (Manual End Mark):

a line of text with a manually set endmark  $\diamond$  some more text, but no automatic endmark set.

Also, one should note, that \hfill is inserted to set the endmark at the right margin.

**5 Example (Quickie)** It also works for short one's.

If you are tired of the greek numbers and the indentation for lemmata ... you can redefine it:

```
\theoremstyle{changebreak}
\theoremheaderfont{\normalfont\bfseries}\theorembodyfont{\slshape}
\theoremsymbol{\ensuremath{\heartsuit}}
\theoremsymbol{\ensuremath{\diamondsuit}}
\theoremseparator{:}
\theoremindent0.5cm
\theoremnumbering{arabic}
\renewtheorem{Lemma}{Lemma}
```

#### 4 Lemma:

another lemma, with a abic numbering ... note that the numbering continues.  $\diamond$ 

the optional argument (i.e. the 'theorem'-name) can be accessed by  $\langle env \rangle$  name.

\begin{Theorem}[somename]
Obviously, we are in Theorem~\Theoremname.
\end{Theorem}

#### 7 Theorem (somename):

Obviously, we are in Theorem somename.

 $\diamond$ 

\*

This feature can e.g. be used for automatically generating executable code and a commented solution sheet:

This will write the C-code to a file solutions/quicksort.c and type it also on the solution sheet.

Now, we define an environment KappaTheorem which uses the same style parameters as Theorems and is numbered together with Corollaries (Theorems are also numbered with Corollaries). Note that we define a complex header text and a complex end mark.

```
\theoremclass{Theorem}
```

```
\theoremsymbol{\ensuremath{a\atop b}}
\newtheorem{KappaTheorem}[Corollary]{\(\kappa\)-Theorem}
```

8  $\kappa$ -Theorem (1st  $\kappa$ -Theorem):

That's the first Kappa-Theorem.

## 4.1 Extended Referencing Features

The standard **\label** command is extended by an optional argument which is intended to contain the "name" of the structure which is labeled, allowing more comfortable referencing; e.g., this section has been started with

```
\subsection*{Extended Referencing Features}%
\label{sec-ExtRef}[Section]
```

As already stated, for theorem-like environments the optional argument is filled in automatically, i.e.,

\begin{Theorem}[Manual End Mark]\label{somelabel}

(cf. page 18) is equivalent to

\begin{Theorem}[Manual End Mark]\label{somelabel}[Theorem]

 $\thref{\langle label \rangle}$  additionally outputs the contents of the optional argument which has been associated with  $\langle label \rangle$ :

```
This is \thref{sec-ExtRef}
A theorem end mark has been set manually in \thref{somelabel}.
A center environment has been shown in \thref{otherlabel}.
The first Kappa-Theorem has been given in \thref{kappatheorem1}.
```

generates

This is Section 4.1.

A theorem end mark has been set manually in Theorem 6. A center environment has been shown in Corollary 4. The first Kappa-Theorem has been given in  $\kappa$ -Theorem 8.

Here one must be careful that the handling of the optional argument is automated only for environments defined by **\newtheorem**, i.e., *not* for sectioning, equations, or enumerations.

Calling  $thref{\langle label \rangle}$  for a label which has been set without an optional argument can result in different unintended results: If  $\langle label \rangle$  is not inside a theorem-like environment, an error message is obtained, otherwise the type of the surrounding theorem-like environment is output, e.g., calling  $thref{label}$  then results in "Theorem  $\langle number \rangle$ "! Additionally, currently there is no support for multiple references such as "see Theorems 5 and 7" (this would require plural-forms for different languages and handling of tef-lists, probably splitting into different sublists for different environments)<sup>4</sup>.

## 4.2 Framed and Shaded Theorems

Framed theorem classes are defined as follows:

```
\theoremclass{Theorem}
\theoremstyle{break}
\newframedtheorem{importantTheorem}[Theorem]{Theorem}
```

 $<sup>^{4}\</sup>mathrm{If}$  someone is interested in programming this, please contact us; it seems to be algorithmically easy, but tedious.

defines important theorems to use the same design as for theorems (except that the break header style is used except the margin header style), number them with the same counter, and put a frame around them: An instance is created by

```
\begin{importantTheorem}[Important Theorem]
This is an important theorem.
\end{importantTheorem}
```

Theorem 9 (Important Theorem): This is an important theorem.

More important theorems are shaded – by default in grey:

```
\theoremclass{Theorem}
\theoremstyle{break}
\newshadedtheorem{moreImportantTheorem}[Theorem]{Theorem]
\begin{moreImportantTheorem}[More Important Theorem]
This is a more important theorem.
\end{moreImportantTheorem}
```

**Theorem 10 (More Important Theorem):** This is a more important theorem.

 $\Diamond$ 

Even more important theorems are shaded in red:

```
\theoremclass{Theorem}
\theoremstyle{break}
\shadecolor{red}
\newshadedtheorem{evenMoreImportantTheorem}[Theorem]{Theorem]
\begin{evenMoreImportantTheorem}[Even More Important Theorem]
This is an even more important theorem.
\end{evenMoreImportantTheorem}
```

Most important theorems get a framed, blue colored box with a shadow. Here, \def\theoremframecommand is used:

```
\theoremclass{Theorem}
\theoremstyle{break}
\shadecolor{red}
```

```
\def\theoremframecommand{%
        \psshadowbox[fillstyle=solid,fillcolor=blue,linecolor=black]}
    \newshadedtheorem{MostImportantTheorem}[Theorem] {Theorem}
    \begin{MostImportantTheorem}[Most Important Theorem]
    This is a most important theorem.
    \end{MostImportantTheorem}
```

## 4.3 Lists of Theorems and Friends

Note, that we put the following lists into the **quote**-environment to emphasise them from the surrounding text. So the lists are indented slightly at the margin. With

```
\addtotheoremfile{Added into all theorem lists},
```

in every list, an additional line of text would be inserted. But it isn't actually done in this documentation since we want to use different list formats. Only for the list of Examples, this one is added:

\addtotheoremfile[Example]{Only concerning Example lists}

With

\theoremlisttype{all}
\listtheorems{Lemma},

all lemmas are listed:

$\alpha$	Display with array	15
eta	Equation	15
$\gamma$	Breakstyle	16
4		18
5		25
6		25

From the examples, only those are listed which have an optional name:

```
\theoremlisttype{opt}
\listtheorems{Example}
```

leads to

0	Extra Entry with number	9
	Extra Entry	10
1	Simple one	15
	Extra Entry	15

4	Using verbatim	17
5	Quickie	18
Only	y concerning Example lists	

One should note the line *Only concerning example lists*, which was added by the \addtotheoremfile-statement above.

For the next list, another layout, using the tabular-environment, is defined:

```
\newtheoremlisttype{tab}%
{\begin{tabular*}{\linewidth}{@{}lrl@{\extracolsep{\fill}r@{}}%
{##1&##2&##3&##4\\}%
{\end{tabular*}}
```

Thus, by saying

theorems (of all importance levels) and lemmata are listed:

Theorem	1	Long Theorem	15
Lemma	$\alpha$	Display with array	15
Lemma	$\beta$	Equation	15
Lemma	$\gamma$	Breakstyle	16
Theorem	3		17
Theorem	5	Quote	17
Theorem	6	Manual End Mark	18
Lemma	4		18
Theorem	7	somename	18
Theorem	9	Important Theorem	20
Theorem	10	More Important Theorem	20
Theorem	11	Even More Important Theorem	20
Theorem	12	Most Important Theorem	21
Theorem	13	Correctness	24
Theorem	14	Completeness	24
Lemma	5		25
Lemma	6		25
Theorem	15		26

 $\ensuremath{\operatorname{IAT}_{\!E\!X}}\xspace$  lists can also be used to form at the theorem list. The input

```
\newtheoremlisttype{list}%
 {\begin{trivlist}\item}
 {\item[##2 ##1:]\ ##3\dotfill ##4}%
 {\end{trivlist}}
\theoremlisttype{list}
\listtheorems{Corollary}
```

leads to

2 Corollary:	Q.E.D	16
4 Corollary:	title in list	17

In this example, after the item,  $\_{\sqcup}$  is used instead of  $_{\sqcup}$ , because in the latter case, dotfill will produce an error if the optional argument (##3) is missing.

## 5 The End Mark Algorithm

## 5.1 The Idea

The handling of endmarks with thmmarks.sty is based on the same two-pass principle as the handling of labels: the necessary information about endmarks is contained in the .aux file.

With thmmarks.sty, T<sub>E</sub>X is always aware whether it is in some theorem-like environment. There, potential positions for endmarks can be

- 1. at the end of simple text lines in open text,
- 2. at the end of displaymaths,
- 3. at the end of equations or equationarrays, or
- 4. at the end of text lines at the end of lists (or, more general, trivlists, such as verbatim or center).

The problem is, that in the cases (2)-(4), the endmarks has to be placed in a box which is already shipped out, when  $\end{\ldots}$  is processed. Thus, in those situations, T<sub>E</sub>X needs to know from the .aux file, whether is has to put an endmark. When T<sub>E</sub>X is in a theorem-like environment and comes to one of the points mentioned in (2)-(4), and the .aux file says that there is an endmark, then it is put there. Anyway, it maintains a counter of the potential positions of an end mark in the current theorem-like environment. When it comes to an  $\end{theorem}$ , it looks if it is in situation (1) (then the endmark is simply put at the end of the current line). Otherwise, the last horizontal box is already shipped out (thus it contains a situation (2)-(4)) and the endmark must be set in it. In this case, a note is written in the .aux file, where the endmark actually has to be set (ie, at the latest potential point for setting an endmark inside the theorem).

## 5.2 The Realization

Let  $\langle env \rangle$  be a theorem-like environment. Then, additional to the counter  $\langle env \rangle$ , T<sub>E</sub>X maintains two counters  $\operatorname{curr}\langle env \rangle \operatorname{ctr}$  and  $\operatorname{end}\langle env \rangle \operatorname{ctr}$ . In the *i*th environment of type  $\langle env \rangle$ ,  $\operatorname{curr}\langle env \rangle \operatorname{ctr} = i$  (the LAT<sub>E</sub>X counter  $\langle env \rangle$  cannot be used since a) environments can use the counter of other environments, and b) often counters are reinitialized inside a document).  $\operatorname{end}\langle env \rangle \operatorname{ctr}$  counts the potential situations for putting an endmark inside an environment. It is set to 1 when starting an environment. Each time, when a situation (2)–(4) is reached, the command

is called (where \thm@romannum just writes the value of a counter as its roman numeral representation, e.g., 17 as xvii).

 $(<\tmcommunum{curr} env \ctr} > (env) < \tmcommunum{end} env \ctr} > uniquely identifies all situations (2)-(4) in a document).$ 

If at this position an endmark has to be set,

 $\label{eq:linear} \label{eq:linear} \label{eq:linear} \\ \label{eq:linear} \label{eq:linear} \label{eq:linear} \end{tabular} \e$ 

is defined in the .aux file to be  $\end(env)$ Symbol, otherwise it is undefined and simply ignored.

When  $T_{EX}$  comes to an  $\end{\langle env \rangle}$ , it looks if it is in situation (1). If so, the endmark is simply put at the end of the current line. Otherwise,

 $\label{eq:linear} $$ def\mark<\thm@romannum{currenvctr}>\langle env\rangle% <\thm@romannum{end}\langle env\ranglectr}>{\langle env}Symbol $$$ 

is written to the .aux file for setting the endmark at the latest potential position inside the theorem in the next run.

#### 13 Theorem (Correctness):

1. For a .tex file, which does not contain nested theorem-like environments of the same type, in the above situation, the following holds: When compiling, at the *i*th situation in the *j*th environment of type  $\langle env \rangle$ , mark  $j \langle env \rangle i$  is handled.

For .tex files which contain nested theorem-like environments of the same type, mark  $k \langle env \rangle l$  is handled, where k is the number of the latest environment of type  $\langle env \rangle$  which has been called at this moment, and l is the number of situations (2)–(4) which have occurred in environments of type  $\langle env \rangle$  since the the kth \begin{{env}}.

2. When finishing an environment, either an endmark is set directly (when in a text line) or an order to put the end symbol at the latest potential position is written to the .aux file.

#### 14 Theorem (Completeness):

The handling of endmarks is complete wrt. plain text, displaymath, equation, eqnarray, eqnarray\*, and all environments ended by endtrivlist, including center and verbatim.

So, where can be bugs ?

- in the plain TEX handling of endmarks,
- in some special situations which have not been tested yet,
- in some special environments which have not been tested yet.
- in the **amsmath** environments. We seldom use them, so we do not know their pitfalls, and we ran only general test cases.

## 6 Problems and Questions

### 6.1 Known Limitations

- Since ntheorem.sty uses the .aux file for storing information about the positions of endmarks, LATEX must be run twice for correctly setting the endmarks.
- Since ntheorem.sty uses the .aux file for storing information about lists in the .thm file, a minimum of two runs is needed. If theorems move in any of these runs up to five runs can be needed to generate correct lists.

- Since we need to expand the optional argument of theorems in various ways for the lists, we decided to copy the text verbatim into the .thm file. Thus, if you use things like \thesection etc., the list won't show the correct text. Therefore you shouldn't use any command that needs to be expanded.
- In nested environments ending at the same time, only the endmark for the inner environment is set, as the following example shows:

```
\begin{Lemma}
Some text.
\begin{Proof} The Proof \end{Proof}
\end{Lemma}
```

yields to

**5 Lemma:** Some text.

**PROOF** The Proof

You can handle this by specifying something invisible after the end of the inner theorem. Then the endmark for the outer theorem is set in the next line:

```
\begin{Lemma}
Some text.
\begin{Proof} The Proof \end{Proof}~
\end{Lemma}
```

yields to

## 6 Lemma:

Some text.

**PROOF** The Proof

⊳

• Document option fleqn is problematic: fleqn handles equations not by \$\$ but by lists (check what happens for

\begin{theorem} \[ displaymath \] \end{theorem}

in standard  $IAT_EX$ : The displaymath is *not* set in an own line). Also, for long formulas, the equation number and the endmark are smashed into the formula at the right text margin.

- Naturally, ntheorem.sty will not work correctly in combination with other styles which change the handling of
  - 1. theorem-like environments, or
  - environments concerned with the handling of endmarks, e.g. \[...\], eqnarray, etc.
- ntheorem.sty is compatible with Frank Mittelbach's theorem.sty, which is the most widespread style for setting theorems.

It cannot be used *with* theorem.sty, but it can be used instead of it.

## 6.2 Known "Bugs" and Problems

• Ending a theorem *directly* after the text, e.g.

\begin{Theorem} text\end{Theorem}

suppresses the endmark:

#### 15 Theorem:

text

Therefore a space or a newline should be inserted before  $\ensuremath{\mathsf{end}}\$ ...}

• With theoremstyle break, if the linebreak would cause ugly linebreaking in the following text, it is suppressed.

## 6.3 Open Questions

- For equations, we decided to put the endmark after the equation number, which is vertically centered. Currently, we do not know, how to get the equation number centered and the endmark at the bottom (one has to know the internal height of the math material).
- The placement of endmarks is mainly based on a check whether IÅTEX is in an ordinary text line when encountering an end-of-environment. This question is *partially* answered by \ifhmode: In a text line, IÅTEX is always in \hmode. But, after an displaymath, IÅTEX is also in \hmode. Thus, additionally \lastskip is checked: after a displaymath, \lastskip=0 holds. In most situations, when text has been written into a line, \lastskip ≠ 0. But, this does not hold, if the source code is of the following form: ...text\label{bla}: then, \lastskip=0. In those situations, the endmark is suppressed.

?? How can it be detected whether LATEX has just ended a displaymath?

• The above problem with the label: The break style enforces a linebreak by  $\fill\penalty-8000$  after the  $\trivlist$ -item. Thus, T<sub>E</sub>X gets back into the horizontal mode. The label places a "whatsit" somewhere ... and, it seems that the "whatsit" makes T<sub>E</sub>X think that there is a line of text.

If someone has a solution to one of those questions, please inform us. (You can be sure to be mentioned in the Acknowledgements.)

## 7 Code Documentation

## 7.1 Documentation of the Macros

```
1 \typeout{Style '\basename', Version \fileversion\space <\filedate>}
2 \ProvidesPackage{ntheorem}[\filedate \space\fileversion]
3 \RequirePackage{ifthen}%
4 \newif\if@thmarks\@thmmarksfalse
5 \newif\if@thref\@threffalse
6 \newif\ifthm@tempif
```

general setup.

#### 7.1.1 Thmmarks-Related Stuff

activate placement of endmarks and define counters for upper level.

\ifsetendmark: true if an endmark has to be set in a complex situation which must be handled by the .aux file. For further comments see \@endtheorem.

\thm@romannum The functionality of latex.ltx's \roman command converts numbers into strings, e.g., 17 into xvii. It is used to put notes into the .aux file. It must be locally defined, just duplicating the definition of \roman in latex.ltx since some packages redefine \roman:

8 \gdef\thm@romannum#1{\expandafter\thm@roman@num\csname c@#1\endcsname}%
9 \gdef\thm@roman@num#1{\romannumeral #1}%

In the following, all relevant environments are changed for handling potential end mark positions:

#### **Changes to List Environment**

Original: ltlists.dtx

\endtrivlist Replaces LATEX's \endtrivlist. An augmented functionality of LATEX's \endtrivlist is contained in \Cendtrivlist.

```
10 \gdef\endtrivlist{%
```

11 \@endtrivlist{\PotEndMark{\unskip\nobreak\hfill\nobreak}}}

At an \endtrivlist (which is called at the end of \list environments and several other environments), \Cendtrivlist is called to end the \trivlist and set a potential position for an endmark at the end of the line if T<sub>F</sub>X is in a text line.

\Cendtrivlist A new command] which augments LATEX's functionality of \endtrivlist by checking if an end mark has to be set:

```
12 \gdef\@endtrivlist#1{% % from \endtrivlist
    \if@inlabel \indent\fi
13
    \if@newlist \@noitemerr\fi
14
    \ifhmode
15
       \ifdim\lastskip >\z@ #1\unskip \par %<<<<<<<
16
             \else \unskip \par \fi
17
       \fi
18
    \if@noparlist \else
19
20
      \ifdim\lastskip >\z@
         \@tempskipa\lastskip \vskip -\lastskip
21
        \advance\@tempskipa\parskip \advance\@tempskipa -\@outerparskip
22
23
        \vskip\@tempskipa
      \fi
24
      \@endparenv
25
    \fi}
26
```

New: parameter **#1**.

**#1** is executed when the **\trivlist** ends with a text line (ie the endmark can be put simply at the end of the line):

Line 16: case split: if in hmode and  $\lastskip > 0$ , then  $T_EX$  is in a text line, the endmark is set here.

#### **Changes to Math Environments**

Original: ltmath.dtx

**\endequation** For equations, end marks are placed behind the equation number:

```
27 \gdef\SetMark@endeqn{\quad}% as default, cf. option leqno
28 \gdef\endequation{\eqno \hbox{\@eqnnum \PotEndMark{\SetMark@endeqn}}%
29 $\global\@ignoretrue}
```

- Line 27: As default, work for equation numbers at the right: Then, a \quad is placed between equation number and endmark.
- Line 28: In addition to the equation number (set by \@eqnnum at the right of the line) \SetMark@endeqn is carried out.
- I If an end mark is set, a displaymath is put into box such that the end marks appears at its bottom level at the right. Thus, also the definition of I has to be changed:

30 \g	gdef\[{%
31	\relax\ifmmode
32	\@badmath
33	\else
34	\ifvmode
35	\nointerlineskip
36	\makebox[.6\linewidth]%
37	\fi
38	<pre>\$\$\stepcounter{end\InTheoType ctr}%</pre>
39	\@ifundefined{mark\thm@romannum{curr\InTheoType ctr}%
40	\InTheoType\thm@romannum{end\InTheoType ctr}}{\relax}%
41	{\ifx\csname\InTheoType Symbol\endcsname\@empty\else
42	\boxmaxdepth=.5ex\begin{array}[b]{@{}1}%
43	\boxmaxdepth=\maxdimen\displaystyle\fi}%
44	\addtocounter{end\InTheoType ctr}{-1}%
45	%%\$\$ BRACE MATCH HACK
46	\fi}

Lines 31–37, 45, 46: the old definition.

Lines 38-41: The end position of a displaymath inside a theorem-environment corresponds to end\InTheoType ctr+1. An endmark has to be set there, if

Lines 42–43: If so, the whole displayed stuff is put in an array with maximal depth 0.5ex and vertically adjusted with its bottom line (then, the endmarks will appear adjusted to its bottom line).

Line 44: The counter has to be re-decremented.

- \] At the end of a displaymath, the end marks is set at its bottom level: 47 \gdef\]{%
  - 48 \stepcounter{end\InTheoType ctr}%

	62 \fi 63 \ignorespaces}
	Lines 48–53: Look, if an endmark has to be set in this displaymath (analogous to
	lines 38–44 of \def\[] If so, there is an inner array which has to be closed (line 52).
	Lines 54–63: the old definition.
	Line 58: changed to set an endmark at the right of the line if necessary (this is done by \eqno).
\endeqnarray	For $eqnarrays$ , the end marks is set below the number of the last equation:
	<pre>64 \gdef\SetMark@endeqnarray#1{\llap{\raisebox{-1.3em}{#1}}} 65 \gdef% 66</pre>
	Line 64: As default work for equation numbers at the right: Then, the endmark is placed below the last equation number at the right margin.
	New: Lines 66, 67, 72:
	Line 66: save \@eqnnum.
	Line 67: define \@eqnnum to carry out \Oldeqnnum, then a potential endmark po- sition is handled: if an endmark is set, between the equation number and the endmark, the command sequence \SetMark@endeqnarray is carried out - there, since \SetMark@endeqnarray is a function of one argument, the endmark will be this argument.
	Lines 68-71: from latex.ltx. Line 68 sets the equation number.
	Line 72: restore \@eqnnum.
\endeqnarray*	<pre>In an \eqnarray*, the end mark is set at the right of the last equation: 73 \@namedef{endeqnarray*}{% 74 % from \@@eqncr: 75 \let\reserved@a\relax 76 \ifcase\@eqcnt \def\reserved@a{&amp; &amp; &amp;}\or \def\reserved@a{&amp; &amp;}% 77 \or \def\reserved@a{&amp;}\else</pre>

```
\let\reserved@a\@empty
78
         \ClatexCerror{Too many columns in eqnarray environment}\Cehc\fi
79
       \reserved@a {\normalfont \normalcolor \PotEndMark{}}%
80
       \global\@eqnswtrue\global\@eqcnt\z@\cr
81
       %
82
        \egroup
83
        \global\advance\c@equation\m@ne
84
     $$\global\@ignoretrue}
85
```

This is just  $IAT_EX$ 's \endeqnarray where lines 75–81 are inserted from \@@eqncr and augmented (line 80) to set a potential endmark (with no additional commands) at the end of the current line.

#### **Changes to Tabbing Environment**

Original: lttab.dtx

\endtabbing Here, the \endtrivlist modification is not sufficient: LATEX is not in hmode when it calls \endtrivlist from \endtabbing; additionally, \@stopline already outputs a linebreak. Thus, the end mark is inserted before \@stopline at the right margin (using \').

```
86 \gdef\endtabbing{%
```

- 87 \PotEndMark{\'}\@stopline\ifnum\@tabpush >\z@ \@badpoptabs
- 88 \fi\endtrivlist}

#### **Changes to Center Environment**

Original: ltmiscen.dtx

\endcenter In LATEX, \endcenter just calls \endtrivlist. Here, the situation is more complex since the the endmark has to be put in the last line without affecting its centering: if in a text line (only then, here is a potential endmark position):

89 \gdef%		
90	\@endtrivlist	
91	{\rightskipOpt%	
92	\settowidth{\leftskip}%	
93	{ \csname mark\thm@romannum{curr\InTheoType ctr}\InTheoType	
94	<pre>\thm@romannum{end\InTheoType ctr}\endcsname}%</pre>	
95	\advance\leftskip\@flushglue\hskip\@flushglue}}}	

The \rightskip of the line is set to 0, \leftskip is set to the width of one space (since on the right, one space is added after the text) plus the endmark and infinitely stretchable glue (\@flushglue), and also the line is continued with \@flushglue (the actual position is one space after the text), and then the endmark is placed (by \PotEndMark).

### Handling of Endmarks

\@endtheorem-thmmarks

 $\ensuremath{\columnwidth}\ensuremath{\column$ 

96 \gdef\@empty{}
97 \gdef\@endtheorem{%

```
98 \expandafter
```

```
99 \ifx\csname\InTheoType Symbol\endcsname\@empty\setendmarkfalse\fi
```

- 100 \@endtrivlist
- 101 {\ifsetendmark

```
102 \unskip\nobreak\hfill\nobreak\csname\InTheoType Symbol\endcsname
```

```
103 \setendmarkfalse \fi}%
```

```
104 \verb+\lisetendmark+OrganizeTheoremSymbol+else+global+setendmarktrue+fi
```

```
105 \content{csname}\nTheoType @postwork\endcsname
```

```
106 }
```

Lines 98, 99: if the end symbol of the environment  $\langle env \rangle$  to be closed is empty, simply no end symbol has to be set (it makes a difference, if no end symbol is set, or if an empty end symbol is set).

Lines 100, 104: (originally, it calls \endtrivlist):

- Lines 100, 102, 103: \@endtrivlist is called to put  $\langle env \rangle$ Symbol at the end of the line and set setendmark to false if  $T_EX$  is in a text line and setendmark is true. At this point, setendmark is false iff the user has disabled it locally or the end symbol is empty.
- Line 101: the endmark is not set, if setendmark is false.
- Line 104: if setendmark is true, the correct placement of the end symbol is organized, else (ie either setendmarkfalse is set by the user, or the endmark is already set by \@endtrivlist) reset setendmark to true.
  - For further comments see \@endtrivlist and \OrganizeTheoremSymbol.

The construction in line 102 guarantees that the endmark is put at the end of the line, even if it is the only letter in this line.

**\NoEndMark** By **\NoEndMark**, the automatical setting of an end mark is blocked for the *current* environment.

107 \gdef\NoEndMark{\global\setendmarkfalse}

set setendmark to false. It is automatically reset to true after the end of the current environment.

 $\$  With  $\$  ded, the user can locally change the end symbol to appear:

```
108 \gdef\qed{\expandafter\def\csname \InTheoType Symbol\endcsname109{\the\qedsymbol}}%
```

When calling \qed, the end symbol of the innermost theorem-like environment at that time is set to the value stored in \qedsymbol at that time.

**\PotEndMark** Handling a potential endmark position:

```
110 \gdef\PotEndMark#1{\SetEndMark{\InTheoType}{#1}}%
```

Argument:  $(cmd\_seq)$ :=#1 is a command sequence to be executed when setting the endmark.

It adds the current theorem type  $\langle env \rangle$  to the parameters, and calls \PotEndMark{ $\langle env \rangle$ }{ $\langle cmd\_seq \rangle$ }.

- \SetEndMark \SetEndMark sets an endmark for an environment. It is called by \PotEndMark.
  - 111 \gdef\SetEndMark#1#2{%
  - 112 \stepcounter{end#1ctr}%

- 113  $\label{eq:linear} \label{eq:linear} \label$
- 114 {\relax}%

```
115 {#2{\csname mark\thm@romannum{curr#1ctr}#1\thm@romannum{end#1ctr}\endcsname
```

```
116 \ifdim\rightmargin>\z@\hskip-\rightmargin\fi
```

```
117 \hbox to Ocm{}}}%
```

Arguments:

 $\langle env \rangle$ :=#1: current theorem-environment.

 $\langle cmd\_seq \rangle := #2:$  is a command sequence to be executed when setting the endmark. Both arguments are transmitted from by \PotEndMark.

Line 112: increments  $end\langle env \rangle ctr$  for preparing the next situation for setting a potential endmark.

```
Line 113, 114: if
```

 $\verb+mark<\text+ltm@romannum{curr}<env\ctr}><env\<\text+ltm@romannum{end}<env\ctr}>$ 

is undefined – which is the case iff at this position no endmark has to be set –, nothing is done,

Line 115: otherwise,  $\langle cmd\_seq \rangle$  and then

```
\mbox{thm@romannum{curr}env}ctr}>\env<\tm@romannum{end}env\ctr}>,
```

which is defined in the .aux file to be the end symbol are called. The construction  $\langle cmd\_seq \rangle \{...\}$  in line 115 allows the handling of the end

symbol as an argument of  $\langle cmd\_seq \rangle$  as needed for \endegnarray.

Line 116: By \hskip-\rightmargin\hbox to Ocm{}, a negative hspace of amount \rightmargin is added *after* the end symbol – thus, the symbol is set as there were no right margin (this concerns, e.g., \quote environments). (applied only if \rightmargin is more than 0 – otherwise bug if preceding line ends with hyphenation.)

Writing to .aux file. (copied from \def\label (ltxref.dtx))

```
118 \newskip\mysavskip
119 \gdef\@bbsphack{%
120 \ifvmode\else\mysavskip\lastskip
121 \unskip\fi}
122 %
123 \gdef\@eesphack{%
124 \ifdim\mysavskip>\z@
125 \vskip\mysavskip \else\fi}
```

Lines 119–121 and 122–124 are similar to \@bsphack and \@bsphack of latex.ltx. They undo resp. redo the last skip.

Note that **@bbsphack** and **@eesphack** are also part of the thref option. Change both if you change them.

\OrganizeTheoremSymbol The information for setting the end marks is written to the .aux file:

126 \gdef\OrganizeTheoremSymbol{%

- 127 \@bbsphack
- 128 \edef\thm@tmp{\expandafter\expandafter\expandafter\thm@meaning
- 129 \expandafter\meaning\csname\InTheoType Symbol\endcsname\relax}%
- 130 \protected@write\@auxout{}%

131 {\string\global\string\def\string\mark%

132 \thm@romannum{curr\InTheoType ctr}\InTheoType \thm@romannum{end\InTheoType ctr}%

133 {\thm@tmp}}%

```
134 \ensuremath{\texttt{Qeesphack}}
```

Lines 130–132: Write

 $\langle env \rangle := \ InTheoType$  gives the innermost theorem-like environment, i.e. the one the end symbol has to be set for.

135 } % end of option [thmmarks]

#### 7.1.2 Option lequo to Thmmarks

leqno is only active it thmmarks is also active.

Line 139, 140: Since with leqno, the equation number is placed on the left, after infinitely stretchable glue, the endmark can be set straight at the right margin.

#### 7.1.3 Option fleqn to Thmmarks

144 \PackageInfo{\basename}{Option 'fleqn' loaded}%

fleqn is only active it thmmarks is also active.

\[ Since fleqn treats displayed math as trivlists, it's quite another thing:

145	\renewcommand\[{\relax
146	\ifmmode\@badmath
147	\else
148	\begin{trivlist}%
149	\@beginparpenalty\predisplaypenalty
150	\@endparpenalty\postdisplaypenalty
151	\item[]\leavevmode
152	\hb@xt@\linewidth\bgroup \$\m@th\displaystyle %\$
153	\hskip\mathindent\bgroup
154	\stepcounter{end\InTheoType ctr}%
155	\@ifundefined{mark\thm@romannum{curr\InTheoType ctr}%
156	\InTheoType\thm@romannum{end\InTheoType ctr}}{\relax}%
157	{\ifx\csname\InTheoType Symbol\endcsname\@empty\else
158	\boxmaxdepth=.5ex\begin{array}[b]{@{}1}%
159	\boxmaxdepth=\maxdimen\displaystyle\fi}%
160	<pre>\addtocounter{end\InTheoType ctr}{-1}%</pre>
161	\fi}

Lines 145–153, 161: the old definition.

Line 154–160: if an endmark has to be set in this displaymath, it is put into an array with depth  $\leq 0.5$ ex, and vertically adjusted to the bottom line.

\] Here, the end mark is placed after a \hfil ate the end of the line containing the displaymath:

162	\renewcommand\]{%
163	\stepcounter{end\InTheoType ctr}%
164	\@ifundefined{mark\thm@romannum{curr\InTheoType ctr}%
165	\InTheoType\thm@romannum{end\InTheoType ctr}}{\relax}%
166	{\ifx\csname\InTheoType Symbol\endcsname\@empty\else
167	\end{array}\fi}%
168	<pre>\addtocounter{end\InTheoType ctr}{-1}%</pre>
169	\relax\ifmmode
170	<pre>\egroup \$\hfil% \$</pre>
171	\egroup
172	\end{trivlist}%
173	\else \@badmath
174	\fi}

Lines 163–167: Look, if an endmark has to be set in this displaymath. If so, close the inner array.

Lines 169–174: the old definition.

Line 170: Added \PotEndMark.

\endequation for equations, the end mark is also set with the equation number:

- 175 \gdef\endequation{%
- 176 \$\hfil % \$
- 177 \displaywidth\linewidth\hbox{\@eqnnum \PotEndMark{\SetMark@endeqn}}%
  178 \egroup
- 179 \endtrivlist}
- Line 177: When the equation number is set, also the endmark is set with the same trick as for \endequation without fleqn.
- \endeqnarray When the equation number is set, also the endmark is set with the same trick as for \endeqnarray without fleqn (see Lines 181, 182, 187):

180 \gdef\endeqnarray{%

- 181 \global\let\Oldeqnnum=\@eqnnum
- 182 \gdef\@eqnnum{\Oldeqnnum\PotEndMark{\SetMark@endeqnarray}}%
- 183 \@@eqncr
- 184 \egroup
- 185 \global\advance\c@equation\m@ne\$\$% \$\$
- 186 \global\@ignoretrue
- 187 \global\let\@eqnnum\Oldeqnnum}

```
188 fi end of option fleqn
```

## 7.1.4 Extended Referencing Facilities

Option thref needs a special handling when combined with amsmath. This is also a reason why it is handled first.

bbsphack(2)

```
192 \newskip\mysavskip
193 \gdef\@bbsphack{%
194 \ifvmode\else\mysavskip\lastskip
195 \unskip\fi}
196 %
197 \gdef\@eesphack{%
198 \ifdim\mysavskip>\z@
199 \vskip\mysavskip \else\fi}
```

Note that **@bbsphack** and **@eesphack** are also part of the thmmarks option. Change both if you change them.

**Communication of theorem types for references.** The thref functionality needs to know the respective theorem type of the referenced labels. This is incorporated as additional arguments in label and newlabel/@newl@abel. Note that if the hyperref package is used, the handling is different (see Option hyperref).

\label The original \label macro is extended (cf. ltxref.dtx) with an optional argument, containing the type of the labeled construct. (when option hyperref is used, )

```
200 \def\label#1{%
                           \@ifnextchar[%]
201
                                             {\label@optarg{#1}}%
202
                                              {\thm@makelabel{#1}}
203
204 %
205 \def\thm@makelabel#1{%

207
                             \edef\thm@tmp{\expandafter\expandafter\expandafter\thm@meaning
208
                                                                    \expandafter\meaning\csname\InTheoType Keyword\endcsname\relax}%
                            \protected@write\@auxout{}%
209
210
                                              {\string\newlabel{#1}{{\@currentlabel}{\thepage}}[\thm@tmp]}%
211
                            \ensuremath{\ensuremath{\mathsf{Qeesphack}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\mathsf{M}}\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{
212 %
213 \def\label@optarg#1[#2]{%
                           \@bsphack
214
                           \protected@write\@auxout{}%
215
                                              {\string\newlabel{#1}{{\@currentlabel}{\thepage}}[#2]}%
216
217
                           \@esphack}
```

- thm@makelabel: If no optional argument is given, the keyword of the current environment type is used instead.
- **label@optarg**: The original definition, extended with the optional argument which is appended to the **\newlabel**-command to be written to the .aux-file.
- \newlabel The original behavior of \newlabel (called when evaluating the .aux-file) is also adapted.

```
Original syntax: \newlabel{\label}}{{\section}}{\page\}}
Modified syntax: \newlabel{\label}} {{\section}}{\page\}}[\page\}]
Definition of \newlabel: \def\newlabel{\@newl@bel r}.
Therefore, the modification is encoded into the \@newl@bel macro:
```

218 \def\@newl@bel#1#2#3{%

```
\label{\label} \lab
```

```
220 \@ifundefined{#1@#2}%
```

```
221
       \relax
       {\gdef \@multiplelabels {%
222
223
          \ClatexCwarningCnoCline{There were multiply-defined labels}}%
        \ClatexCwarningCnoCline{Label '#2' multiply defined}}%
224
     global@namedef{#10#2}{#3}%
225
226
     \@ifnextchar[{\set@label@type{#1}{#2}}%]
227
                   \relax
228 \def\set@label@type#1#2[#3] {%
     \global\@namedef{#1@#2@type}{#3}}
229
```

the macro is called with three arguments (same as originally):

#1=r,

 $\langle labelname \rangle := #2$  is the label name,

**#3** is a pair (section, page-number) consisting of the values needed for \ref and \pageref, respectively.

Line 219: adaptation to babel

Lines 220–225: The original definition (both standard LATEX and babel).

Line 226: if an optional argument follows (containing the environment-type), continue with \set@label@type, otherwise return (the original behavior).

Lines 228,229: set \r@(labelname)@type to the type of the respective environment.

```
\thref \thref is an adaptation of \ref:
```

230 \def\thref#1{%

```
231 \expandafter\ifx\csname r@#1@type\endcsname\None
```

232 \PackageWarning{\basename}{thref: Reference Type of '#1' on page

- 233 \thepage \space undefined}\G@refundefinedtrue
- 234 \else\csname r@#1@type\endcsname~\fi%

```
235 \expandafter\@setref\csname r@#1\endcsname\@firstoftwo{#1}}
```

Lines 230,235: similar to ref.

- Line 219: if a legal theorem type is given, then output  $r@\langle labelname \rangle @type$  and avoid linebreaking between the type and the number.
- \testdef A problem occurred, when about 250 labels to theorem-like environments have been defined: after the end of a document, the .aux file is read once more (to check if references changed). Here, LATEX redefines \@newl@bel into \@testdef and LATEX does not know that ntheorem's \label has an additional optional argument. Thus, the argument values are not processed, but are output as normal text. Normally, this did not matter since output has already been finished by a \clearpage in \end{document}. For so many labels, a page gets filled and the output routine is called.

```
236 \newcommand\org@testdef{}
237 \let\org@testdef\@testdef
238 \def\@testdef#1#2#3{%
239 \org@testdef{#1}{#2}{#3}%
240 \@ifnextchar[{\thm@gobbleopt}}}%
241 }
242 \newcommand\thm@gobbleopt{}
243 \long\def\thm@gobbleopt[#1]{}
```

Line 239: process the optional argument.

# 7.1.5 Option amsmath to Thmmarks

Most of the commands are extensions of commands in amsmath.sty.

247 \PackageInfo{\basename}{option 'amsmath' handling for 'thref' loaded}%

if thref is active, the handling of labels in amsmath equations has also to be adapted.

#### ams-thref

248 \let\ltx@label\label

keep the handling of **\label** ... (the one defined above in the thref option). amsmath implements a special handling of **\label** inside of displaymath environments. It is extended to process the optional argument provided be the thref option:

```
249 \global\let\thm@df@label@optarg\@empty
250 \def\label@in@display#1{%
       \ifx\df@label\@empty\else
251
            \@amsmath@err{Multiple \string\label's:
252
               label '\df@label' will be lost}\@eha
253
254
       \fi
       \gdef\df@label{#1}%
255
       \@ifnextchar[{\thm@label@in@display@optarg}{\thm@label@in@display@noarg}%]
256
257 }
258 \def\thm@label@in@display@noarg{%
       \global\let\thm@df@label@optarg\@empty
259
260 }
261 \def\thm@label@in@display@optarg[#1]{%
262
       \gdef\thm@df@label@optarg{#1}%
263 }
```

The contents of \df@label is handled when the equation is finished. (Currently) this happens in three macros. The modification consists of the check if \thm@df@label@optarg is non-empty (i.e., holds the optional argument), and to handle it.

```
264 \def\endmathdisplay@a{%
     \if@eqnsw \gdef\df@tag{\tagform@\theequation}\fi
265
     \if@fleqn \@xp\endmathdisplay@fleqn
266
     \else \ifx\df@tag\@empty \else \veqno \alt@tag \df@tag \fi
267
       \ifx\df@label\@empty \else
268
         \ifx\thm@df@label@optarg\@empty \@xp\ltx@label\@xp{\df@label}%
269
270
                    \else \@xp\ltx@label\@xp{\df@label}[\thm@df@label@optarg]\fi
          \fi
271
     \fi
272
     \ifnum\dspbrk@lvl>\m@ne
273
       \postdisplaypenalty -\@getpen\dspbrk@lvl
274
       \global\dspbrk@lvl\m@ne
275
     \fi

                  324
                 Lines 317, 318: store the original macros.
                 Line 319: if equation numbers are set as default, call \SetTagPlusEndMark to set
```

tag and end mark. Lines 320, 321: if a tag is set manually, call \SetTagPlusEndMark to set tag and end

```
mark.
```

Line 322: otherwise, call \SetOnlyEndMark to set only an end mark.

# \SetOnlyEndMark

325 <b>\</b> g	gdef%
326	\global\tag@true
327	\iftagsleft@
328	\gdef\df@tag{\hbox
329	to \displaywidth{\hss\PotEndMark{\maketag@@@}}}%
330	\else
331	\gdef\df@tag{\PotEndMark{\maketag@@@}}%
332	\fi}
Set	only an end mark:

Line 326: force setting the end mark as a tag:

Lines 328,329: if tags are set to the left, the tag consists of a hbox over the whole displaywidth, with the (potential) endmark at its right.

Line 331: if tags are set to the right, the tag consists only of the (potential) endmark.

## \SetTagPlusEndMark

333 <b>\newd</b> :	imen{\tagwidth}
334 <b>\gdef</b>	%
335	\iftagsleft@
336	\gdef\maketag@@@##1{%
337	\settowidth{\tagwidth}{\$##1\$}%%%% MM 17.10.2007
338	\hbox to %
339	\hbox to \m@th\normalfont##1%
340	\hss\PotEndMark{\hss}}\hss}%
341	\else
342	\gdef\maketag@@@##1{\m@th\normalfont##1%
343	<pre>\llap{\hss\PotEndMark{\raisebox{-1.3em}}}}%</pre>
344	\fi}

Set a tag *and* an end mark:

Lines 334-343: redefine the \maketag@@@ macro:

- Lines 335–339: if tags are set to the left, build a box of the whole displaywidth and put the original tag on the left, and the (potential) endmark at the right. Put this box with width 0 and continue.
- Lines 340,341: if the tags are set to the right, the (potential) end mark is put below it.
- - 345 \let\ams@@maketag@@@\maketag@@@
  - 346 \gdef\tagform@#1{%
  - 347 \ams@@maketag@@@{(\ignorespaces#1\unskip\@@italiccorr)}}

## \RestoreTags

348 \gdef\RestoreTags{%

349 \global\let\maketag@@@=\Old@maketag@@@

350 \global\let\df@tag=\Old@df@tag}

Lines 349,350: restore the original macros.

**\endgather** In the **gather** environment, just the augmented tag is used:

- $351 \ \end{gather} \$ 352\TagsPlusEndmarks % <<<<<< 353\math@cr \black@\totwidth@ 354 \egroup 355 \$\$% 356 % <<<<<< 357\RestoreTags 358\ignorespacesafterend} 359 % 360 \expandafter\let\csname endgather\*\endcsname\endgather New: Line 352: the last tag contains the potential endmark.
- Line 357: restore the original macros.
- Line 360: Since let always takes the expansion of a macro when the let is executed, all let's have to be adjusted (this is the same for all subsequent let-statements).

#### \math@cr@@@align

\endalign \endalign also uses the augmented tags:

361 \def%		
362 \ifingat	her@\else	% <<<<<<
363 \Tags	PlusEndmarks\fi	. % <<<<<<<
364 \math@cm		
365 \black@	totwidth@	
366 \egroup		
367 \ifingather@	1	
368 \restore	alignstate@	
369 \egroup		
370 \nonumbe	er	
371 \ifnum0=	'{\fi\iffalse}\	fi
372 \else		
373 <b>\$\$%</b>		
374 \Restore	Tags	% <<<<<<
375 \fi		
376 \ignorespace	esafterend}	

## New:

Lines 362, 363: if the align is not inside another environment, its tags have to contain the endmarks.

Line 374: this case, the original macros have to be restored.

```
377 \expandafter\let\csname endalign*\endcsname\endalign
378 \let\endxalignat\endalign
379 \expandafter\let\csname endxalignat*\endcsname\endalign
380 \let\endxxalignat\endalign
381 \let\endalignat\endalign
382 \expandafter\let\csname endalignat*\endcsname\endalign
383 \let\endflalign\endalign
384 \expandafter\let\csname endflalign*\endcsname\endalign
```

Adjust let-statements.

\lendmultline The multline environment has two different \end commands, depending if the equation numbers are set on the left or on the right:

385 \def\lendmultline@{%

```
386 \global\@eqnswfalse\tag@false\tagsleft@false
```

387 \rendmultline@}

End of multline environment if tags are set to the left: in this case, the last line of a multline does not contain a tag. Thus the situation of setting an endmark tag at the right is faked:

Lines 386, 387: display no equation number, don't set an equation tag (but use the tag mechanism for the end mark - see \TagsPlusEndmarks and \SetOnlyEndMark), set it at the right, and call \rendmultline.

\rendmultline \rendmultline also uses the augmented tags:

388 \d	lef\rendmultline@{%	
389	\TagsPlusEndmarks	% <<<<<<
390	\iftag@	
391	\$\let\endmultli	ne@math\relax
392	\ifshifttag	0
393	\hskip\	multlinegap
394	\	vtop{%
395	\ra	ise@tag

# 7.1.6 Theorem-Layout Stuff

```
442 \let\thm@usestd\@undefined
443 \DeclareOption{standard}{\let\thm@usestd\relax}
444 \let\thm@noconfig\@undefined
445 \DeclareOption{noconfig}{\let\thm@noconfig\relax}
```

Options for selection of a configuration: if no such option is given ntheorem.cfg will be loaded (which has to be provided by the user), [standard] will load ntheorem.std, a predefined setting, and [noconfig] does not preload any configuration.

- 446  $\gdef\InTheoType{None}$
- 447  $\gdef\NoneKeyword{None}$
- 448 \gdef\NoneSymbol{None}
- 449 \gdef \None{None}

Set \InTheoType to none on the upper document level.

\newtheoremstyle With \newtheoremstyle, new theorem-layout styles are defined.

450 \gdef\newtheoremstyle#1#2#3{%

- 451 \expandafter\@ifundefined{th@#1}%
- 452 {\expandafter\gdef\csname th@#1\endcsname{%
- 453 \def\@begintheorem###1###2{#2}%
- 454 \def\@opargbegintheorem###1###2####3{#3}}}%
- 455 {\PackageError{\basename}{Theorem style #1 already defined}\@eha}}

Arguments:

 $\langle style \rangle :=$  #1: the name of the theoremstyle to be defined,

 $(cmd\_seq1):=$ #2: command sequence for setting the header for environment instances with no optional text,

 $\langle cmd\_seq2 \rangle$ :=#3: command sequence for setting the header for environment instances with optional text. Line 451: if this style is not yet defined, define it. Line 452: define \th@ $\langle style \rangle$  to be a macro which defines Line 453: a) the two-argument macro \@begintheorem#1#2 to be  $\langle cmd\_seq1 \rangle$ , Line 454: b) \@opargbegintheorem#1#2#3 to be  $\langle cmd\_seq2 \rangle$ .

The predefined theorem styles use this command.

#### \renewtheoremstyle

456 \gdef\renewtheoremstyle#1#2#3{%

```
457 \expandafter\@ifundefined{th@#1}%
458 {\PackageError{\basename}{Theorem style #1 undefined}\@ehc}%
```

```
459 {}%
```

```
460 \expandafter\let\csname th@#1\endcsname\relax
```

Arguments:

```
\langle style \rangle :=#1: the name of the theoremstyle to be defined,
#2, #3 as for \newtheoremstyle.
Checks, if theoremstyle \langle style \rangle is already defined. If so, \th@\langle style \rangle is made undefined and \newtheoremstyle is called with the same arguments.
```

# **Predefined Theorem Styles**

```
theoremstyles th@plain, th@change, and th@margin taken from theorem.sty by Frank Mittelbach; the break-styles have been changed.
```

519 \Cnamedef{thCmarginbreakNo}{\thCnonumberbreak}
520 \@namedef{th@changebreakNo}{\th@nonumberbreak}
For instance, break is commented:
\newtheoremstyle{break} results in
```

Then, calling \th@break sets \@begintheorem as follows: Since each theorem environment is basically a trivlist, the header is set as the item contents: \theorem@headerfont holds the font commands for the header font, ##1 is the keyword to be displayed, and ##2 its environment number. The linebreak after the header is achieved by offering to fill the line with space and the distinct wish to put a linebreak after it. Thus, if plain text follows, the line break is executed, but if a list or a display follows, it is not executed.

<pre>\theoremstyle The handling of \theoremstyle, \theorembodyfont, and \theoremskipamounts     is taken from theorem.sty by Frank Mittelbach:         S21 \gdef\theoremstyle#1{%         S22 \@ifundefined{th@#1}{\@wrning         S23 {Unknown theoremstyle '#1'. Defines theorem styles plain, definition, and remark, and environment proof according to amsthm.sty.

# 7.1.7 Theorem-Environment Handling Stuff

Original: ltthm.dtx

 $620 \ \$ 

An auxiliary variable.

### Defining New Theorem-Environments.

#### \newtheorem

621 \gdef\newtheorem{%
622 \newtheorem@i%
623 }

\newtheorem@i The syntax of the original \newtheorem is retained. The macro is extended to deal with the additional requirements:

	(O ( CM
625	\@ifstar
626	${\operatorname{\mathbb{C}}} $
627	{\PackageError{\basename}{Theorem style {nonumber\the\theorem@style}
628	undefined (you need it here for newtheorem*) }\@ehc}%
629	0%
630	\edef\@tempa{{nonumber\the\theorem@style}}%
631	$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $
632	{\edef\@tempa{{\the\theorem@style}}%
633	\expandafter\theorem@@style\@tempa\@newtheorem}}

#### renewtheorem

634	<pre>4 \gdef%</pre>
635	5 \@ifstar
636	<pre>3 {\expandafter\@ifundefined{th@nonumber\the\theorem@style}%</pre>
637	<pre>{\PackageError{\basename}{Theorem style {nonumber\the\theorem@style}</pre>
638	undefined (you need it here for newtheorem*) }\@ehc}%
639	
640	<pre>&gt;</pre>
641	\expandafter\theorem@@style\@tempa\@renewtheorem}%
642	<pre>2 {\edef\@tempa{{\the\theorem@style}}%</pre>
643	<pre>% \expandafter\theorem@@style\@tempa\@renewtheorem}}</pre>
А	nalogous to \newtheorem

Analogous to \newtheorem.

\@newtheorem \@newtheorem does the main job for initializing a new theorem environment type. It is called by \newtheorem.

```

```

691 \@ifnextchar[{\@othm{#1}}{\@nthm{#1}}}% MUST NOT BE IN ANY IF !!!

Argument:  $\langle env \rangle$ :=#1 is the (internal) environment name to be defined, which is read from the LATEX source.

Line 646: check if  $\langle env \rangle$  is not yet defined (or is redefined).

Lines 648–673 are executed exactly if  $\langle env \rangle$  and  $\langle env \rangle^*$  are not yet defined.

Line 648: \thm@tempif=true iff  $\langle env \rangle$  and  $\langle env \rangle^*$  are not yet defined.

Line 649: Initialize theorem list handling for  $\langle env \rangle$ .

Lines 651–654: if thmmarks is active and the counters are not yet defined, for every theorem-like, define

 $\operatorname{curr}\langle env \rangle \operatorname{ctr}$ : in the *i*th environment of type  $\langle env \rangle$ ,  $\operatorname{curr}\langle env \rangle \operatorname{ctr} = i$ , and  $\operatorname{end}\langle env \rangle \operatorname{ctr}$ : when the innermost environment is of type  $\langle env \rangle$ , in the *j*th potential position for an end mark in this environment,  $\operatorname{end}\langle env \rangle \operatorname{ctr} = j$ . (if the counters are already defined,  $\langle env \rangle$  is redefined, and these internal counters have to be continued).

Lines 656–673: define several commands: (\xdef expands the definition at the time it is called and makes it global):

- Line 656: store the current value of  $\theoremsymbol (\edef: expand \the \theoremsymbol now) as <math>\langle env \rangle$ Symbol.
- Line 657: store the current value of  $\teorempostwork$  ( $\edef: expand \teorempostwork now$ ) as  $\langle env \rangle$  postwork.

Lines 658-660, 661-663: Define the commands \env and \env\* to set the header of \env. (using a switch \thm@starredenv: \relax iff starred).

Lines 664, 665: Set  $\end \langle env \rangle \ast$  to  $\end \langle env \rangle$ .

- Lines 666-676: define  $setparms@\langle env \rangle$  to set the style parameters of the header for every  $\langle env \rangle$  environment (in the sequel, *current* means, at the moment  $\env{env}$  is called):
- Lines 667, 668: setting \theorem@headerfont to the *current* value of \theoremheaderfont, followed by a check if it is a bold style,
- Lines 669, 670: setting \theorem@separator to the *current* value of \theoremseparator,

Lines 671, 672: setting \theorem@prework to the *current* value of \theoremprework,

- Lines 673, 674: setting \theorem@indent to the current value of \theoremindent,
- Line 675: executing the command sequence currently stored in \theorembodyfont, and
- Line 676: calling th@\the\theorem@@style (which initializes \@begintheorem and \@opargbegintheorem according to the *current* value of \theoremstyle by calling th@\the\theorem@@style).
- Line 677–691: define th@class@(env) to initialize all style parameters as they are set for the (env) environment.

Note, that the \@ifdefinable from line 646 ends after line 691.

Line 692: According to the next character, call  $\operatorname{Oothm}(\langle env \rangle)$  (if another counter is used) or  $\operatorname{Oothm}(\langle env \rangle)$ .

Thus, when calling \@newthm with #1= $\langle env \rangle$ , for current values \theoremstyle=plain, \theorembodyfont=\upshape, \theoremheaderfont=\bf, \theoremseparator=:, \theoremindent=1cm, \theoremnumbering=arabic, and \theoremsymbol=\Box, the macro \setparms@ $\langle env \rangle$  is defined as

and the macro  $\th@class@(env)$  is defined as

Note, that line 675 must not be inside  $any \if...\fi$  construct.

#### \@renewtheorem

```
692 \gdef\@renewtheorem#1{%
693 \expandafter\@ifundefined{#1}%
694 {\PackageError{\basename}{Theorem keyword #1 undefined}\@ehc}%
695 {}%
696 \expandafter\let\csname #1\endcsname\relax
697 \expandafter\let\csname #1*\endcsname\relax
698 \@newtheorem{#1}}
```

Argument:  $\langle env \rangle$ :=#1 is the (internal) environment name to be redefined, which is read from the LATEX source.

If  $\langle env \rangle$  is already defined, make it (and  $\langle env \rangle^*$ , too) undefined and call  $\langle env \rangle$ }.

\Onthm \Onthm is called by \Onewtheorem if the environment to be defined has a counter of its own.

```
699 \gdef\@nthm#1#2{%
```

```
700 \expandafter\protected@xdef\csname num@addtheoremline#1\endcsname{%
```

- 701 \noexpand\@num@addtheoremline{#1}{#2}}%
- 703 \noexpand\@nonum@addtheoremline{#1}{#2}}%
- 704  $\theoremkeyword{#2}%$
- 705 \expandafter\protected@xdef\csname #1Keyword\endcsname
- 706 {\the\theoremkeyword}%
- 707 \@ifnextchar[{\@xnthm{#1}{#2}}{\@ynthm{#1}{#2}}}
- Arguments:

 $\langle env \rangle$ :=#1 is the (internal) environment name to be defined (transmitted from \@newtheorem).

 $\langle output\_name \rangle := #2$  is its keyword to be used in the output (read from the LATEX source).

Lines 700-703: Define (no)num@addtheoremline(env) to call

 $\c(no)$ num@addtheoremline{(env)}{ $(output\_name)$ }.

For comments on \@num@addtheoremline and \@nonum@addtheoremline see Section 7.1.9.

- Lines 704-706: Define  $\langle env \rangle Keyword \langle env \rangle$  to typeset/output  $\langle output\_name \rangle$ . (note the similarity with the handling of  $\theoremsymbol$  for handling complex keywords)
- Line 707: According to the next character, call  $\langle env \rangle \{ \langle output\_name \rangle \}$  (if  $\langle env \rangle$ -environments should be numbered relative to some structuring level) or  $\langle uput\_name \rangle \}$ .
- \Cothm \Cothm is called by \Cnewtheorem if the environment to be defined uses another counter.

```
708 \gdef\@othm#1[#2]#3{%
```

- 709 \@ifundefined{c@#2}{\@nocounterr{#2}}%
- 710 {\ifthm@tempif

802 \def\newframedtheorem#1{%

# 7.1.9 Generation of Theorem Lists

The generation of lists of theorems, definitions, etc. is based The following macros are are needed for the generation of theorem-lists. We will document it for the theorem \begin{definition}[optional], which we assume to be the first definition at all and which is placed on page 5. \thm@thmcaption This macro, used internally, strips of the outer brackets from the second argument and calls \thm@@thmcaption. It's typically called like this

```
\thm@thmcaption{definition}{{Definition}{1}{optional}}
```

(internal name of the environment, output keyword, running number, optional text) 808 \def\thm@thmcaption#1#2{\thm@@thmcaption{#1}#2}

\thm@@thmcaption \thm@caption is called from \thm@caption; it writes an appropriate entry to the .thm-file.

809 \def\thm@@thmcaption#1#2#3#4{%

- 810 \thm@parseforwriting{#2}%
- 811 \let\thm@tmpii\thm@tmp
- 812 \thm@parseforwriting{#4}%
- 813  $\edef\tm@t{{\tm@tmpii}{#3}{\tm@tmp}}%$
- 814  $\dcontentsline{thm}{#1}{\thm@t}$

Arguments:  $\langle env \rangle := \#1$  is the internal environment name,  $\langle output\_name \rangle := \#2$  is its keyword to be used in the output, #3 is the running number, and #4 is the optional text argument in the header.

Lines 809,810: the command sequence for the output keyword is prepared by \thm@parseforwriting(which returns \thm@tmpii) and then stored in \thm@tmpii.

Line 811: the optional text is also prepared by \thm@parseforwriting

Lines 812,813: The output is collected and written into the .aux file, which will forward it to the theorem-file.

The following two macros are just shortcuts, often needed for the output of one single line in the theorem-lists. The first one is used in unnamed lists, the second one in named. Warning: Don't remove the leading \let, since you will get wrong \if-\fi-nesting without it, if you don't use hyperref.

## \thm@@thmline@noname

815 \def\thm@@thm	line@noname#1#2#3#4{%
816	<pre>@dottedtocline{-2}{0em}{2.3em}%</pre>
817	{\protect\numberline{#2}#3}%
818	{#4}}

## \thm@@thmline@name

819 <b>\d</b> e	f\thm@@thmline@name#1#2#3#4{%
820	$\clime{-2}{0em}{2.3em}$
821	{#1 \protect\numberline{#2}#3}%
822	{#4}}

\thm@thmline This is another short one, which only discards the outer brackets from the first argument and calls \thm@@thmline. It's normally called like this:

## \thm0@thmline{{Definition}{1}{optional}}{5}

823 \def\thm@thmline#1#2{\thm@@thmline#1{#2}}

\thm@lgobble The following macros are used to ignore entries for theorem sets, that should not occur in a given list:

824 \long\def\thm@lgobble@entry#1#2{\ignorespaces}

825 \long\def\thm@lgobble@freetext#1#2{\ignorespaces}

The following four macros set up the predefined list-types. To do so, they define the internal macros \thm@@thmlstart (containing the code to be executed at the beginning of the list), \thm@@thmlend (code to be executed at the end of the list) and \thm@@thmline (code to be executed for every line). In order to gain compatibility with newthm.sty, we decided not to make this commands inaccessible to the user. But we recommend not using these commands, because they may disappear in later distributions.

\theoremlistall	This one implements the type all.
	<pre>826 \def\theoremlistall{% 827 \let\thm@@thmlstart=\relax 828 \let\thm@@thmlend=\relax 829 \let\thm@@thmline@thmline@noname}</pre>
\theoremlistallname	And here's the type allname.
	<pre>830 \def\theoremlistallname{% 831 \let\thm@@thmlstart=\relax 832 \let\thm@@thmlend=\relax 833 \let\thm@@thmline=\thm@@thmline@name}</pre>
\theoremlistoptional	This one is the list-type opt. In case of [hyperref], the fifth argument, which is provided by hyperref.sty is automatically given to \thm0@thmline@noname.
	834 \def\theoremlistoptional{%         835 \let\thm@@thmlstart=\relax         836 \let\thm@@thmlend=\relax         837 \def\thm@@thmline##1##2##3##4{%         838 \ifx\empty ##3%         839 \else         840 \thm@@thmline@noname{##1}{##2}{##3}{##4}%         841 \fi}
\theoremlistoptname	And the last type, optname. In case of [hyperref], the fifth argument, which is provided by hyperref.sty is automatically given to \thm@@thmline@name. 842 \def% 843 \let\thm@@thmlstart=\relax 844 \let\thm@@thmlend=\relax 845 \def\thm@@thmline##1##2##3##4{%
	846       \ifx\empty ##3%         847       \else%         848       \thm0@thmline@name{##1}{##2}{##3}{##4}%         849       \fi}
\theoremlisttype	The next one is the user-interface for selecting the list-type. It simply calls \thm@thml@(type), if the given (type) is defined. 850 \def\theoremlisttype#1{% 851 \@ifundefined{thm@thml@#1}% 852 {\PackageError{\basename}{Listtype #1 not defined}\@eha}%
	<pre>853 {\csname thm@thml@#1\endcsname}} Now, here is the code, which maps the types - selected by \theoremlisttype - to the defined macros. 854 \def\thm@thml@all{\theoremlistall}</pre>

```
855 \def\thm@thml@opt{\theoremlistoptional}
                       856 \def\thm@thml@optname{\theoremlistoptname}
                       857 \def\thm@thml@allname{\theoremlistallname}
                       According to the given documentation, this one can be used to define new list-
 \newtheoremlisttype
                        types. It's done by defining the macro \tm@thml@(type), which locally redefines
                       the commands \thm@thmlstart, \thm@@thmline and \thm@@thmlend.
                       858 \def\newtheoremlisttype#1#2#3#4{%
                            \@ifundefined{thm@thml@#1}%

                       863
                            }{\PackageError{\basename}{list type #1 already defined}\@eha}}
                       864
\renewtheoremlisttype
                       865 \def\renewtheoremlisttype#1#2#3#4{%
                            \@ifundefined{thm@thml@#1}%
                       866
                              {\PackageError{\basename}{List type #1 not defined}\@ehc}{}%
                       867
                            \expandafter\let\csname thm@thml@#1\endcsname\relax
                       868
                            \mbox{newtheoremlisttype{#1}{#2}{#3}{#4}}
                       869
                       if the list type to be redefined is already defined, make it undefined and define it.
      \thm@definelthm For each theorem-set, we need to initialize two commands:
                           • how to typeset entries in the list, lo(theorem-set). it is called for each
                             theorem when the list is generated.
                           • how to typeset additional text in the list, \thm@listdo(theorem-set). It is
                             called, when something is to a list with \addtotheoremfile.
                       These macros are initially defined by \newtheorem to discard the input by calling
                        \thm@lgobble@entry (for actual entries) and \thm@lgobble@freetext (for free
                        text added by the user). These macros must be adapted if a package uses another
                       format for \contentsline entries in the .aux file (e.g., hyperref).
                       870 \def\thm@definelthm#1{%
                       871 \expandafter\gdef\csname l@#1\endcsname{\thm@lgobble@entry}%
                       872 \expandafter\gdef\csname thm@listdo#1\endcsname{\thm@lgobble@freetext}}
        \thm@inlistdo
                       When additional text is added to a theorem list via \addtotheoremfile, this is
                        typeset by the following is macro. It simply discards the first argument and strips
                       of the outer brackets from the second one.
                       873 \long\def\thm@inlistdo#1#2{#2}%
        \listtheorems The following macro provides the user interface:
                       874 \def\listtheorems#1{\begingroup
                            c@tocdepth=-2%
                       875
                            \def\thm@list{#1}\thm@processlist
                       876
                            \endgroup}
                       877
                      Line 874: #1 is a list of theorem sets, i.e., of the form Theorem or Theorem, Definition, ....
                      Line 875: set tocdepth to -2 to assure that the predefined list-types work.
```

Line 876: store the list of names in thm@list and call \thm@processlist, which actually generates the list.

 $\time{processlist}$  The file (jobname).thm contains commands of the form

 $\contentsline{\langle list-of-theorem sets \rangle}{\{\langle header \rangle}{\langle number \rangle}}{\langle page \rangle}.$ Thus, dependent on which theorem sets should be listed,  $\contentsline$  must be defined to evaluate the first argument and then to output all arguments, or to discard the second and third one.

This is done as follows: The commands l((theorem-set)) and thm@listdo((theorem-set))(which initially were set to ignore everything by newtheorem) are redefined for the theorem sets which should be listed to generate output. contentsline is defined to call l(theorem-set), adding a line to the list or ignoring the entry. Since for theorem sets which are not yet known (i.e., if the list is created at the beginning of the document, and the theoremset is only defined later), l(theorem-set) is not yet defined, contentsline has to check if the command is defined, otherwise ignore the arguments.

Then, the .thm file is processed, evaluating the \contentsline commands. After processing the .thm file, the mentioned commands are again redefined to discard everything. We need to define the macros globally for dealing with complex, user-defined, list-types.

# \thm@enablelistoftheorems Up

of theorems Up to now, we've set up various macros for writing and reading the theorem-file. Thus, it's time to set up the file itself. This is done by the next macro. We simply took the lines for \@starttoc from the LATEX-base and changed some things. The main intention to copy \@starttoc is that we don't want the file to be input when it is set up - like it's done by \@starttoc.

	904 \def\thm@enablelistoftheorems{%
	905 \begingroup
	906 \makeatletter
	907 \if@filesw
	908 \expandafter\newwrite\csname tf@thm\endcsname%
	909 \immediate\openout \csname tf@thm\endcsname \jobname.thm\relax%
	910 \fi
	911     \@nobreakfalse       912     \endgroup}
	ars /eughtonbl
\addtheoremline	By \addtheoremline{ $\langle theorem-set \rangle$ }{ $\langle entry \rangle$ }, the user can insert an extra entry into the theorem-file. \addtheoremline* calls the internal macro \nonum@addtheoremline, otherwise \num@addtheoremline is called. \num/nonum@addtheoremline{ $\langle theorem-set \rangle$ }{ $\langle entry \rangle$ } calls \num/nonum@addtheoremline $\langle theorem-set \rangle$ { $\langle entry \rangle$ } which are defined when $\langle theorem-set \rangle$ is declared (cf. \@nthm). These in turn call \@num/nonum@addtheoremline{ $\langle theorem-set \rangle$ } }{ $\langle keyword \rangle$ }{ $\langle entry \rangle$ } which write information to the theorem file.
	913 \def\addtheoremline{\@ifstar{\nonum@addtheoremline}{\num@addtheoremline}} 914 \def\nonum@addtheoremline#1{\csname nonum@addtheoremline#1\endcsname}% 915 \def\num@addtheoremline#1{\csname num@addtheoremline#1\endcsname}%
\@nonum@addtheoremline	\@num@addtheoremline and \@nonum@addtheoremline write the actual entries to the .thm file.
	Syntax: $\nonum@addtheoremline{ \langle theorem-set \rangle}{\langle keyword \rangle}{\langle entry \rangle}$
	916 \def\@nonum@addtheoremline#1#2#3{%
	917 \thm@parseforwriting{#3}%
	918 \edef\thm@t{{#2}{}\thm@tmp}}%
	919 \addcontentsline{thm}{#1}{\thm@t}}
$\column Caddtheoremline$	
	920 \def\@num@addtheoremline#1#2#3{%
	921 \thm@parseforwriting{#3}%
	922 \edef\thm@t{{#2}{\csname the#1\endcsname}{\thm@tmp}}%
	923 \addcontentsline{thm}{#1}{\thm@t}}%
\addtotheoremfile	To write any additional stuff into the theorem-file, the next macro is used. It first checks, if the optional name of a theorem-set is given. In that case, the macro \@@addtotheoremfile, otherwise \@addtotheoremfile is used to write the stuff
	into the file.
	924 \long\def%
	925 \@ifnextchar[{\@@addtotheoremfile}{\@addtotheoremfile}}
\@addtotheoremfile	Write additional stuff for all theorems.
	926 \long\def\@addtotheoremfile#1{%
	927 \thm@parseforwriting{#1}%
	928 \protected@write\@auxout% 929 {}{\string\@writefile{thm}{\thm@tmp}}}
	272 () (/2011HR/AMIIOLIIE(0HH) (/0HHA0Hh)))
\@@addtotheoremfile	Write additional stuff for a given theorem-set.
	930 \long\def\@@addtotheoremfile[#1]#2{% 931 \thm@parseforwriting{#2}%
	931 \thm@parselorwriting{#25% 932 \protected@write\@auxout%
	933 {}{\string\@writefile{thm}{\string\theoremlistdo{#1}{\thm@tmp}}}}

\theoremlistdo This one is called from the theorem-file to insert the additional stuff for a theoremset.

```
934 \long\def\theoremlistdo#1#2{\expandafter\@ifundefined{thm@listdo#1}%
935 \relax{\csname thm@listdo#1\endcsname{#1}{#2}}
```

Now we assure, that the theorem-file is activated. This is done by inserting a hook at the end of the document.

936 \AtEndDocument{\thm@enablelistoftheorems}

**Theoremlists and Hyperref** Since the hyperref-package redefines \contentsline, some commands are redefined:

- Let the different versions of \thm@@thmline@.. take a 5th argument, the one provided by hyperref.
- 2. handle contentsline: restore the normal definition at the beginning of \thm@processlist (see there), that calls l@(*theorem-set*) that in turn calls the adapted commands for typestting the entries (see below).
- Let \thm@lgobble@entry take one more argument, the one provided by hyperref.
- 4. Do the hyperlinks manually in the different versions of \thm@@thmline as defined by the theorem types.

### **Theorem References and Hyperref**

hyperref-thref When hyperref is active, the handling of thref described above via the .aux file redefinition of \@newl@bel is not possible (hyperref forces its definitions at \AtBeginDocument). Instead, an internal identifier of the form Theorem.1.1 is used in the .aux file for the hypertarget (using the type of the counter; thus when a theorem type uses another counter, this does not give the theorem type itself). The same id is stored in the .thm file for the respective theorem. by this, given the id from the \newlabel in the .aux file, the .thm file can be searched for the actual type information.

```
990 \if@thref
991 \def\@firstofthree#1#2#3{#1}%
992 \def\getKeywordOf#1{%
993 \let\thm@oldcontentsline\contentsline
994 \def\contentsline##1##2##3##4{%
     ifthenelse{\equal{#1}{##4}}{\otintstofthree}#2}{}%
995
996
     \ignorespaces}%
997 \@input{\jobname .thm}%
998 \let\contentsline\thm@oldcontentsline
999 }
1000 \def\thm@fmt@hyplabel@i#1#2#3#4#5{%
1001
     \getKeywordOf{#4}~\thm@fmt@hyplabel@ii#4}
1002 \def\thm@fmt@hyplabel@ii#1.#2{#2}%
1003 \def\thref#1{%
1004 \expandafter\@setref\csname r@#1\endcsname\thm@fmt@hyplabel@i{#1}}%
1005 \fi \% end of \if@thref
```

- Lines 991-999: given an id #1 of the form Theorem.1.1, scan the .thm file for a \contentsline whose 4th argument equals the id. If found, the third component of its second argument gives its theorem type.
- Lines 1000-1002: this command must have 5 arguments because it is applied to the information stored with \newlabel in the .aux file. The 4th argument is the id #4 of the form Theorem.1.1.

Get the correct keyword by \getKeywordOf{#4} and its number (which is the part following the first ".").

Lines 1003-1004: create a hyperlink via (Osetref (see hyperref.sty)):  $(\texttt{Osetref} takes three arguments: <math>\texttt{rQ}(label) := arg_1$  is the information from newlabel in the .aux file (consisting of 5 components). The 2nd argument  $arg_2$  must be a command that uses 5 arguments, here thmQfmtQhyplabelQi(#1) as defined in Lines 1000-1002. The 3rd one is the label, and is only used for error messages. Qsetref then -roughly- applies  $arg_2$  on  $arg_1$ .

# 7.1.10 Auxiliary macros

For generating theorem-lists, we need to write information into a separate file. Beause we don't want to expand this information, we parse it specially for writing.

```
1007 \def\thm@meaning#1->#2\relax{#2}% remove "macro: ->"
```

```
1008 \long\def\thm@parseforwriting#1{%
```

```
1009 \def\thm@tmp{#1}%
```

1010 \edef\thm@tmp{\expandafter\thm@meaning\meaning\thm@tmp\relax}}

In some countries it's usual to number theorems with greek letters:

\theorem@checkbold For correctness, we need to check if a bold font is active. This is done by the following macro:

1011 \def\theorem@checkbold{\if b\expandafter\@car\f@series\@nil\boldmath\fi}

- \@greek Accoding to LATEX-base, this is the internal command for generating lowercase greek numberings.
  - 1012 \def\@greek#1{\theorem@checkbold%
  - 1013 \ifcase#1\or\$\alpha\$\or\$\beta\$\or\$\gamma\$\or\$\delta\$\or\$\varepsilon\$%

  - 1015  $\mus\ors\varsigmas\ors\taus$
  - 1016 \or\$\upsilon\$\or\$\varphi\$\or\$\psi\$\or\$\omega\$\else\@ctrerr\fi}
- \@Greek According to LATEX-base, this is the internal command for generating uppercase greek numberings.
  - 1017 \def\@Greek#1{\theorem@checkbold%
  - 1018 \ifcase#1\or A\or B\or\$\Gamma\$\or\$\Delta\$\or E%
  - 1019 \or Z\or H\or\$\Theta\$\or I\or K\or\$\Lambda\$\or M%
  - 1020 \or N\or\$\Xi\$\or O\or\$\Pi\$\or P\or\$\Sigma\$\or T%
  - 1021 \or\$\Upsilon\$\or\$\Phi\$\or X\or\$\Psi\$\or\$\Omega\$\else\@ctrerr\fi}
- \greek According to LATEX-base, this is the user interface for lowercase greek numberings. 1022 \def\greek#1{\@greek{\csname c@#1\endcsname}}
- \Greek According to LATEX-base, this is the user interface for uppercase greek numberings. 1023 \def\Greek#1{\@Greek{\csname c@#1\endcsname}}

# 7.1.11 Other Things

After declaring several package-options, we need to process the specified ones. The additional \relax was mentioned by Rainer Schöpf at DANTE'97.

```
1024 \ProcessOptions\relax
```

Now we set up the default theorem listtype. Make sure this is called after processing the options. Otherwise, **ntheorem** will break with **hyperref**.

#### 1025 $\$ theoremlistall

If automatical configuration is not disabled by [noconfig], it is checked if the file ntheorem.cfg exists and in this case the definitions in this file are read. If it does not exist and the option standard was specified, the file ntheorem.std is used.

```
1026 \ifx\thm@noconfig\@undefined

# 8 History and Acknowledgements

# 8.1 The endmark-Story (Wolfgang May)

In 1995, I started a hack for setting endmarks semiautomatically at the end of displayed formulas. The work on thmmarks.sty begun in October 1996 by a thread asking for a routine for setting endmarks in *de.comp.tex* initiated by Boris Piwinger. Version 0.1 incorporated the main features for setting endmarks automagically by using the .aux file. Version 0.2 included some bugfixes and was the first one accessible on the internet. Boris suggested to include fleqn and leqno which has been done in version 0.3 (which was never made public). Since at this point, thmmarks.sty was incompatible to the widely used theorem.sty written by Frank Mittelbach, in Version 0.4, the features of theorem.sty have been integrated.

With version 0.5, the case of "empty" end symbols has been handled, \qed has been added (also suggested by Boris), and the handling of theoremstyles by \newtheoremstyle has been included.

For version 0.6, the handling of endmarks in displaymaths has been changed in order to adjust them with the bottom of the displayed math.

Version 0.6 was the first one announced in *comp.text.tex*. For version 0.7, I added the handling of **amsmath** features, suggested by my colleague Peter Neuhaus. Versions 0.71 and 0.72 incorporated minor bugfixes.

# 8.2 Lists, Lists, Lists (Andreas Schedler)

I often saw questions on theoremlists in the german newsgroup *de.comp.text.tex*, but I never spent any attention on those postings. This changed in summer 1996, when I needed those lists for myself. Thus, I asked the holy question. But none of the given answers satisfied my wish for a simple, easy to use and short solution.

I decided to take a look at Frank Mittelbachs theorem.sty. First I didn't understand much of the code, but Bernd Raichle helped me a lot by answering my boring questions and I finally understood it.

I started the coding and within a few days, a first experimental version was born. Not only that I had implemented the lists, I also inserted a separator and a flexible numbering of the theorems. After a long period of testing, I wanted to share the new features with other  $T_{EX}$ -Freaks and wrote an article for the "Die  $T_{EX}$ nische Komödie" (Journal of german tug, DANTE e.V.). As soon as I had sent the article to DANTE, I got first reactions on the style. Gerd Neugebauer gave me many hints. I hided several cryptical notations in easy definitions and improved the user interface.

In January 1997, I released "newthm" to the world and it was uploaded to the CTAN-Archives. Few days later I sent my files to Frank Mittelbach in order to show him my extensions. He told me, that already other extensions were made, and that it would be good to combine alltogether.

# 8.3 Let's come together

With version 0.8, in February 1997, the combination of thmmarks.sty with newthm.sty to ntheorem.sty has been started. On April 21, 1997, version 0.94 beta has been made public as version 1.0.

In course of the development, the following changes were made:

You should create the list of changes by

makeindex -s gglo.ist -o ntheorem.gls ntheorem.glo

and running latex ntheorem.drv again.

# 8.4 Acknowledgements

This place is dedicated to all those, who helped us developing our separate styles and this combined package. Thanks to (listed in alphabetical order):

Donald Arseneau, Giovanni Dore, Oliver Karch, Frank Mittelbach, Gerd Neugebauer, Heiko Oberdiek, Boris Piwinger, Bernd Raichle, Rainer Schöpf, Didier Verna.
